

1 **Supplementary material**

2 1 Supplementary information on field trial

3 The soil in this field trial was an acidic clay loam soil (44 % sand, 30 % silt, 26 % clay, all w/w) with a
4 pH of 6.0, 3.47 mg/kg nitrate N, 0.84 mg/kg ammonium N, and 16.2 kgN/ha available N in the top 30
5 cm, 42.0 mg/L available P, 130 mg/L available K and 88.5 mg/L available Mg. Organic matter loss on
6 ignition was 7.7 % w/w and the cation exchange capacity was 17.4 cmol(+)/kg (analyses performed
7 on soil sampled in March 2017 before applying fertilisers).

8 The herbicide solution contained 200 L water, 1 L Optica (Headland Agrochemicals Ltd., Flintshire,
9 UK), 21 g ALLY MAX SX (Du Pont UK Ltd., Herts, UK) and 0.45 L AXIAL (Syngenta UK Ltd, Cambridge,
10 UK), and 1 L of the adjuvant ADIGOR (Syngenta UK Ltd, Cambridge, UK), and was applied at a rate of
11 ca. 200 L/ha.

12 In order to take the differential amounts of husks and de-husked grains into account when consuming
13 whole grains (including husks), their respective weights were determined. In our samples, a typical
14 grain including the husk and bran, but not the awn, consisted of 9 ± 0.5 % husk and 91 ± 0.5 % grain
15 (including bran; values in weight percent, denoting average $\pm 1\sigma$ including all plots).

16 2 Supplementary tables and figures

17 **Table S.1 ICP-MS parameters**

Operating Conditions	
ICP-MS	Agilent 8800 ICP-QQQ-MS
ICP RF Power (W)	1550
Plasma gas	Ar
nebulizer gas flow (L min^{-1})	1.18
nebulizer type	MicroMist Nebulizer
sample uptake rate (mL min^{-1})	ca. 0.5 mL/min
sampler cone	nickel
skimmer cone	nickel
reaction/collision gas flows (mL min^{-1})	
He	3.9
H ₂	3.7
O ₂	0.3
integration time	0.1 or 0.2, depending on isotope
detection mode	dual
internal standard	¹⁰³ Rh and ⁸⁹ Y with various gases
<i>m/z</i> measured	
no additional gas	11 (B), 59 (Co), 66 (Zn), 86 (Sr), 95 & 98 (Mo), 111 (Cd), 206–208 (Pb)
with He	51 (V), 52 (Cr), 60 (Ni)
with H ₂	52 (Cr), 75 (As)
with O ₂	67 (V), 91 (As)

18

19

20 **Table S.2 MP-AES parameters**

Operating Conditions	
MP-AES	Agilent 4200 MP-AES
Plasma gas	N ₂
nebulizer pressure	160 kPa
nebulizer type	pneumatic nebulizer with cyclonic spray chamber
sample introduction system	Autosampler Agilent Technologies SPS 3
wavelengths measured	213.857 nm (Zn), 371.993 nm (Fe), 285.213 nm (Mg), 324.754 nm (Cu), 396.847 nm (Ca), 403.076 (Mn), 407.771 nm (Sr), 769.897 nm (K)

21

22 **Table S.3 Recovery of certified reference materials in MP-AES analyses; values in brackets indicate**
 23 *expanded uncertainty about the mean to cover the measurand with approximately 95 % confidence*

Table S.5 Selected measured compositional data of seaweed-fertilised, NPK fertilised and unfertilised bere barley grains, husks and straw with respect to selected elements; values given as weighted averages of seven single measurements (one measurement each for four replicate plots, and triplicate measurements for one replicate plot) for each treatment type $\pm 1\sigma$; letters indicate the results of one-way ANOVA and Tukey post-hoc tests, whereby different letters indicate significant differences ($p < 0.05$) between treatments for each sample type (separately for grain, husk and straw); where no significant differences were found between treatments for the plant part, no letters are given; complete set of data reported in Table S.6

Sample type	Fertilisation treatment	Fe (µg/g)	Mg (µg/g)	Cu (µg/g)	Ca (µg/g)	K (%)	V (ng/g)	Cr (µg/g)	Co (ng/g)	Ni (µg/g)	Zn (µg/g)	Pb (ng/g)

51 a)

52

53 b)

54

55 **Fig. S.1** Score plots (left) and loading plots (right) of two principal component analyses of all measured
56 element concentrations and isotope ratios (without $\delta^{15}\text{N}$ in a), and including the unreliable $\delta^{15}\text{N}$
57 values in b)) in grain, straw and husk samples, indicating the changes induced by the different
58 fertilisation treatments; these results indicate that for the elements and isotope ratios measured in
59 this study, differences between the different parts of the plant tend to be larger than the
60 compositional differences induced by fertilisation

61 **Table S.7** Measured compositional data of the composted seaweed and NPK fertilisers; results are
 62 mean values $\pm 1\sigma$ of triplicate analyses; the bioavailability of these elements likely varies significantly;
 63 *Bateman and Kelly, 2007; **manufacturer information for Yaramila maincrop 14-14-21 NPK
 64 fertiliser
