# ABSTRACT

#### Background

A variety of minimally invasive treatments are available as an alternative to transurethral resection of the prostate (TURP) for management of lower urinary tract symptoms (LUTS) in men with benign prostatic hyperplasia (BPH). However, it is unclear which treatments provide better results.

#### Objectives

Our primary objective was to assess the comparative effectiveness of minimally invasive treatments for lower urinary tract symptoms in men with BPH through a network meta-analysis. Our secondary objective was to obtain an estimate of relative ranking of these minimally invasive treatments, according to their effects.

#### Search methods

We performed a comprehensive search of multiple databases (CENTRAL, MEDLINE, Embase, Scopus, Web of Science and LILACS), trials registries, other sources of grey literature, and conference proceedings, up to 24 February 2021. We had no restrictions on language of publication or publication status.

#### Selection criteria

We included parallel-group randomized controlled trials assessing the effects of the following minimally invasive treatments, compared to TURP or sham treatment, on men with moderate to severe LUTS due to BPH: convective radiofrequency water vapor therapy (CRFWVT); prostatic arterial embolization (PAE); prostatic urethral lift (PUL); temporary implantable nitinol device (TIND); and transurethral microwave thermotherapy (TUMT).

#### Data collection and analysis

Two review authors independently screened the literature, extracted data, and assessed risk of bias. We performed statistical analyses using a random-effects model for pair-wise comparisons and a frequentist network meta-analysis for combined estimates. We interpreted them according to Cochrane methods. We considered a minimally important difference of three points for the International Prostate Symptoms Score[IPSS]. We used the GRADE approach to rate the certainty of evidence.

#### Main results

We included 27 trials involving 3017 men, mostly over age 50, with severe LUTS due to BPH. The overall certainty of evidence was low to very low due to concerns regarding bias, imprecision, inconsistency (heterogeneity), and incoherence. Based on the network meta-analysis, results for our main outcomes were as follows.

Urologic symptoms (19 studies, 1847 participants): PUL and PAE may result in little to no difference in urologic symptoms scores compared to TURP (3 to 12 months; MD of IPSS range 0 to 35; higher scores indicate worse symptoms; PUL: 1.47, 95% CI -4.00 to 6.93; PAE: 1.55, 95% CI -1.23 to 4.33; low-certainty evidence). CRFWVT, TUMT, and TIND may result in worse urologic symptoms scores compared to TURP at short-term follow-up, but the CIs include little to no difference (CRFWVT: 3.6, 95% CI -4.25 to 11.46; TUMT: 3.98, 95% CI 0.85 to 7.10; TIND: 7.5, 95% CI -0.68 to 15.69; low-certainty evidence).

Quality of life (QoL) (13 studies, 1459 participants): All interventions may result in little to no difference in the QoL scores, compared to TURP (3 to 12 months; MD of IPSS-QoL score; MD range 0 to 6; higher scores indicate worse symptoms; PUL: 0.06, 95% CI -1.17 to 1.30; PAE: 0.09, 95% CI -0.57 to 0.75; CRFWVT: 0.37, 95% CI -1.45 to 2.20; TUMT: 0.65, 95% CI -0.48 to 1.78; TIND: 0.87, 95% CI -1.04 to 2.79; low-certainty evidence).

Major adverse events (15 studies, 1573 participants): TUMT probably results in a large reduction of major adverse events compared to TURP (RR 0.20, 95% CI 0.09 to 0.43; moderate-certainty evidence). PUL, CRFWVT, TIND and PAE may also result in a large reduction in major adverse events, but CIs include substantial benefits and harms at three months to 36 months; PUL: RR 0.30, 95% CI 0.04 to 2.22; CRFWVT: RR 0.37, 95% CI 0.01 to 18.62; TIND: RR 0.52, 95% CI 0.01 to 24.46; PAE: RR 0.65, 95% CI 0.25 to 1.68; low-certainty evidence).

Retreatment (10 studies, 799 participants): We are uncertain about the effects of PAE and PUL on retreatment compared to TURP (12 to 60 months; PUL: RR 2.39, 95% CI 0.51 to 11.1; PAE: RR 4.39, 95% CI 1.25 to 15.44; very low-certainty evidence). TUMT may result in higher retreatment rates (RR 9.71, 95% CI 2.35 to 40.13; low-certainty evidence). There was insufficient data to include data on CRFWVT and TIND in this analysis.

Erectile function (six studies, 640 participants): We are very uncertain of the effects of minimally invasive treatments on erectile function (MD of International Index of Erectile Function [IIEF-5]; range 5 to 25; higher scores indicates better function; CRFWVT: 6.49, 95% CI -8.13 to 21.12; TIND: 5.19, 95% CI -9.36 to 19.74; PUL: 3.00, 95% CI -5.45 to 11.44; PAE: -0.03, 95% CI -6.38, 6.32; very low-certainty evidence).

Ejaculatory dysfunction (eight studies, 461 participants): We are uncertain of the effects of PUL, PAE and TUMT on ejaculatory dysfunction compared to TURP (3 to 12 months; PUL: RR 0.05, 95 % CI 0.00 to 1.06; PAE: RR 0.35, 95% CI 0.13 to 0.92; TUMT: RR 0.34, 95% CI 0.17 to 0.68; low-certainty evidence). There was insufficient data to include data on CRFWVT and TIND in this analysis.

TURP is the reference treatment with the highest likelihood of being the most efficacious for urinary symptoms, QoL and retreatment, but the least favorable in terms of major adverse events, erectile function and ejaculatory function. Among minimally invasive procedures with sufficient data for analysis, PUL and PAE have the highest likelihood of being the most efficacious for urinary symptoms and QoL, TUMT for major adverse events, CRFWVT and TIND for erectile function and PUL for ejaculatory function.

#### Authors' conclusions

Minimally invasive treatments may result in similar or worse effects concerning urinary symptoms and QoL compared to TURP at short-term follow-up. They may also result in fewer major adverse events. PUL and PAE resulted in better rankings for symptoms scores and PUL may result in fewer retreatments, especially compared to TUMT, which had the highest retreatment rates. We are very uncertain about the effects of these interventions on erectile and ejaculatory function. There was limited long-term data, especially for CRFWVT and TIND. Future high-quality studies with more extended follow-up, comparing different, active treatment modalities, and adequately reporting critical outcomes relevant to patients, including those related to sexual function, could provide more information on the relative effectiveness of these interventions.

# PLAIN LANGUAGE SUMMARY

#### How do minimally invasive treatments compare to traditional surgery for treating lower urinary tract symptoms in men?

#### Background

Older men often suffer from urinary complaints such as frequent urination or a weak urine stream. If these symptoms can be blamed on an enlarged prostate gland and lifestyle changes and medications don't help enough, there are surgical procedures that may help. One such procedure is called transurethral resection of the prostate (traditional surgery). This traditional surgery has been widely used for a

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

long time, and is known to work well, but it does require anesthesia and has several unwanted effects. Other 'minimally invasive' surgical procedures have become available. These procedures are said to work similarly well, but with fewer unwanted effects. The five minimally invasive procedures are 'prostatic urethral lift', 'convective radiofrequency water vapor therapy', 'transurethral microwave thermotherapy', 'prostatic arterial embolization', and 'temporary implantable nitinol device'.

#### **Review question**

We performed this review to compare five newer treatment forms for men with lower urinary tract symptoms to traditional surgery or 'sham surgery'. In sham surgery, men thought they were getting surgery but really did not have anything done.

#### Methods

We used recommended Cochrane methods and GRADE to rate the certainty of evidence. We also used a special statistical method called network meta-analysis to compare different treatments.

#### Search date

The findings of our study are up-to-date until February 2021.

#### **Included studies**

We included 27 randomized controlled trials. In this type of study, random 'chance' determined whether men were assigned to receive one of the newer surgical procedures, or traditional surgery (or sham surgery). This method of assigning participants to 'intervention' or 'control' groups helps to reduce bias in research studies.

Men were mostly over 50 years of age and had severe urinary symptoms. Most studies (16 studies) used transurethral microwave thermotherapy. Eleven studies followed men for less than one year and nine studies followed men for one year. Only seven studies followed men for two years or longer.

#### Funding

Most studies did not report their funding sources, while others reported that those who paid for the study received at least some money for the company that made the device that was used.

#### **Key results**

We only report the results for what we thought were the three most important outcomes: urinary symptoms, urinary quality of life, and unwanted effects, comparing these treatments to traditional surgery. The review also includes information on several other outcomes and how they compared to sham surgery.

Prostatic urethral lift and arterial embolization may result in little to no difference in men's symptoms than traditional surgery in the short term (up to 12 months). The other minimally invasive interventions may result in worse symptom scores than traditional surgery at short-term follow-up, but there may be no difference. All treatments may result in little to no difference in the quality of life compared to traditional surgery at short-term follow-up. Transurethral microwave thermotherapy probably results in a large reduction in major adverse events compared to traditional surgery, whereas the other minimally invasive treatments may result in a large reduction in major adverse events. Transurethral microwave thermotherapy may result in higher retreatment rates, but we are uncertain about the other minimally invasive procedures. We are also uncertain of the effects of these interventions on erectile function and ejaculation.

#### **Certainty of evidence**

Our level of certainty about the evidence was different for each of the outcomes, but was mostly low or very low. This means that we cannot be sure that the results of this review are accurate. A common reason for grading down the certainty of evidence included flaws in the ways the studies were planned and conducted. Also, the results differed a lot among studies, and the results of studies were often imprecise.

Cochrane Database of Systematic Reviews

CI: confidence interval; CRFWVT: convective radiofrequency water vapor therapy; IPSS: International Prostate Symptom Score; MD: mean difference; PAE: prostatic arterial embolization; PUL: prostatic urethral lift; SUCRA: surface under the cumulative ranking curve; TIND: temporary implantable nitinol device; TUMT: transurethral microwave thermotherapy; TURP: transurethral resection of prostate.

Network meta-analysis summary of findings table definitions:

\* Estimates are reported as mean difference and CI.

\*\* Rank statistics is defined as the probability that a treatment out of n treatments in a network meta-analysis is the best, the second, the third, and so on until the least effective treatment. Between brackets are the surface under the curve (SUCRA) estimates.

# GRADE Working Group grades of evidence (or certainty of the evidence).

High certainty: we are very confident that the true effect lies close to that of the estimate of the effect.

**Moderate certainty:** we are moderately confident in the effect estimate: the true effect is likely to be close to the estimate of the effect, but there is a possibility that it is substantially different.

Low certainty: our confidence in the effect estimate is limited: the true effect may be substantially different from the estimate of the effect.

Very low certainty: we have very little confidence in the effect estimate: the true effect is likely to be substantially different from the estimate of effect.

<sup>a</sup>TURP was the highest-ranked intervention for this outcome with a mean rank of 1.7 (SUCRA 88.9%)

<sup>b</sup>Downgraded by one level due to major concerns on within-study bias: nearly all studies contributing to this estimate had an overall high risk of bias.

<sup>c</sup>Downgraded by one level due to major concerns on imprecision: the estimate crosses the threshold for minimally important difference (three points for IPSS) and the line of no effect.

<sup>d</sup>Downgraded by one level due to some concerns on imprecision and inconsistency (heterogeneity): the estimate and prediction interval cross one threshold for minimally important difference (three points for IPSS)

<sup>e</sup>Downgraded by one level due to some concerns regarding inconsistency (heterogeneity): the prediction interval crosses one threshold for minimally important difference (three points for IPSS).

### BACKGROUND

#### **Description of the condition**

The prostate gland is an organ in males. It is approximately the size of a walnut, and is located below the urinary bladder encircling the urethra (Leissner 1979). Benign prostatic obstruction (BPO) is a form of bladder outlet obstruction and may be diagnosed when the cause of outlet obstruction is known to be benign prostatic enlargement (BPE) due to benign prostatic hyperplasia (BPH); however, the latter is restricted to the histological diagnosis, defined as increased numbers of epithelial and stromal cells in the prostate (Abrams 2003). BPH may or may not cause lower urinary tract symptoms (LUTS), characterized by urination frequency, hesitancy, and a weak stream, mainly in men over the age of 40, and receives clinical relevance when associated with perceived bother (Dunphy 2015). Symptom bother typically correlates with increased number and severity of symptoms, which are related to both the impairment in the quality of life and treatment-seeking (Agarwal 2014). Although we understand that LUTS is a functional unit with a multi-factorial etiology of associated symptoms, we considered the term BPH for this Cochrane Review due to its familiarity with the general public (EAU 2021).

The degree of bother across all LUTS can be assessed through selfadministered questionnaires, namely, the International Prostate Symptom Score (IPSS; also known as the American Urological Association [AUA] Symptom Index), which includes the quality of life domain (Barry 1995). Chapple 2017 reported that increasing LUTS severity was associated with worsening men's overall distress through the patient perception of the bladder condition, which is a single-item global question (with responses ranging from 1 (causes no problems at all) to 6 (causes severe problems)).

Progression of LUTS has been observed in up to 31% of men with BPH at seven-year follow-up (Emberton 2008). Progression to acute urinary retention is less frequent, and in men with moderate symptoms can range from 3.0 per 1000 person-years in those aged 40 to 49 years to 34.7 per 1000 person-years in those aged 70 to 79 years (Emberton 2008). BPH also has a negative impact on public health and reduces a person's quality of life (Kozminski 2015; Martin 2014). In Europe, 30% of men over 50 years of age, equivalent to 26 million men, are affected by bothersome LUTS, including storage symptoms (such as urinary frequency, urgency, and nocturia) or voiding symptoms (such as urinary hesitancy, weak urinary stream, straining to void, and prolonged voiding), or both. The yearly reported associated number of medical prescriptions was estimated to be around 11.6 million for 74 million people at risk from 2004 to 2008 (Cornu 2010). According to an international study involving 7588 men, the prevalence of LUTS was 18% during their 40s, 29% in their 50s, 40% in their 60s, and 56% in their 70s (Homma 1997). More recent data show the lifetime prevalence of BPH as 26.2% (95% confidence interval (CI) 22.8% to 29.6%) (Lee 2017).

#### Diagnosis

Initial evaluation of LUTS suggestive of BPH includes patient history, physical examination including a digital rectal examination (DRE), urinalysis, a prostate-specific antigen (PSA) blood test if a diagnosis of prostate cancer changes management, use of a voiding diary, and IPSS (EAU 2021; McVary 2011). A DRE is performed to assess both nodules suspicious for cancer and prostate size; recently, additional imaging studies have been recommended for patients considering surgical intervention (Foster 2019).

PSA is secreted by the prostate gland and is found to be abnormally elevated in conditions such as prostate cancer, BPH, infection, or inflammation of the prostate (EAU 2021; McVary 2011). The IPSS is used to assess urinary symptom severity and quality of life. It is also used to document subjective responses to treatment (Barry 1992; EAU 2021; McVary 2011). Measurement of maximum flow rate ( $Q_{max}$ ) and postvoid residual (PVR) is often used in diagnosis and treatment decisions (EAU 2021; McVary 2011). A low  $Q_{max}$  and a large PVR predict an increased risk of symptom progression (Crawford 2006). Other tests such as radiological imaging, urodynamic evaluation, and cystoscopy can help the clinician determine appropriate treatment and predict treatment response (Egan 2016; McVary 2011).

#### Treatment

Treatment decisions are based on symptoms, and the degree of symptom bother noted by the patient. Initial treatment options for BPH include conservative management (watchful waiting and lifestyle modification) and the use of medications (alpha-blockers, 5-alpha reductase inhibitors, and, recently, phosphodiesterase inhibitors) (EAU 2021; McVary 2011). When patients have been refractory to conservative and medical treatment, or if BPH causes subsequent complications, such as acute urinary retention, recurrent urinary tract infection, bladder stones, haematuria, or renal insufficiency, surgical options are considered (EAU 2021; McVary 2011).

Until the 1970s, the only option available to treat this condition and relieve LUTS was open simple prostatectomy (in very large prostates) or endoscopic surgery in the form of transurethral prostatectomy, with the aim of removing or resecting prostatic tissue to open up the blocked urethra (Pariser 2015). Clinical guidelines continue to recommend monopolar or bipolar transurethral resection of the prostate (TURP) as a ('gold') reference standard treatment to provide subjective symptom relief while attaining objective improvement in urinary flow (Alexander 2019; EAU 2021; McVary 2011), but this procedure is associated with some morbidity and long-term complications, including hematuria, possibly requiring a blood transfusion, urethral stricture, urinary tract infection, and incontinence, and it usually requires at least overnight hospitalisation. Moreover, men may experience ejaculatory (65%) and erectile dysfunction (10%) related to TURP (Roehrborn 2003). Furthermore, BPH is a disease that is common among elderly men, who have increased preoperative risk for complications of general anesthesia and surgery in general (Dunphy 2015; Yoo 2012).

Recently, several other minimally invasive treatments (MITs) that can be performed in an office setting and do not require general anesthesia have been developed as alternatives to TURP (EAU 2021; McVary 2011) to provide therapeutic alternatives involving lower morbidity. However, most men who consider surgical intervention do so with the expectation that this is a more definitive therapy for LUTS that will preclude the need for additional medical or surgical therapy. Given the relatively high rate of reoperation or continued use of medical therapy after surgical treatment (or both), concern has been raised about the durability of newly launched minimal invasive surgeries (NICE 2015; Strope 2015).

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Copyright © 2021 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

## **Description of the intervention**

Minimally invasive treatments that can be performed in an office setting and do not require general anesthesia include convective radiofrequency water vapor therapy (CRFWVT), prostatic arterial embolization (PAE), prostatic urethral lift (PUL), a temporary implantable nitinol device (TIND), and transurethral microwave thermotherapy (TUMT).

# Convective radiofrequency water vapor therapy

The Rezūm system (NxThera Inc., Maple Grove, MN, USA) uses radiofrequency to create thermal energy in the form of water vapor to ablate prostatic tissue (Woo 2017). This system consists of two main components: a radiofrequency power supply generator and a single-use transurethral delivery device that incorporates a standard rigid cystoscope lens, which allows the procedure to be performed under direct visualization. Water vapor thermal energy is generated by applying a radiofrequency current against an inductive coil heater. The handheld control delivers water vapor, providing a consistent energy dose of ~ 208 calories into the prostate tissue through a retractable needle (Woo 2017). CRFWVT is performed with the person in the dorsal lithotomy position, using conscious sedation. A cystoscopic examination is performed to confirm the contours of the prostate and the planned distribution of thermal lesions (Darson 2017; Dixon 2015; Woo 2017). The treatment needle is positioned for starting approximately one centimeter distal from the bladder neck and targeting the transition and central prostate adenoma by eye. Each injection of water vapor lasts approximately nine seconds. Additional injections of vapor are delivered every one centimeter from the initial injection site of the prostatic urethra to the proximal edge of the verumontanum. The total number of injections in each lobe of the prostate is determined by the length of the prostatic urethra and the configuration of the prostate gland (Dixon 2015; Woo 2017). Saline flush irrigation is used to enhance visualization and to cool the urethral surface (Woo 2017). Although most adverse events are transient and are classified as Clavien-Dindo Grade I or II, a non-randomized pilot study has reported 125 adverse events in 45 of 64 participants (69.2%) (Dixon 2015). The most common adverse events are postoperative urinary retention (33.8%), dysuria (21.5%), urinary urgency (20%), and suspected urinary tract infection (20%). Twelve serious adverse events were reported in 10 participants, one of which was suspected to be a procedure- or device-related adverse event (Clavien-Dindo Grade IIIb urinary retention) (Dixon 2015).

#### **Prostatic arterial embolization**

Embolization of the prostatic arteries has historically been used to control persistent or massive prostatic bleeding not otherwise amenable for treatment, with typical causes being BPH and locally advanced prostate cancer, or to treat hemorrhage occurring after TURP (Mitchell 1976). DeMeritt 2000 reported a case in which PAE was performed with polyvinyl alcohol particles for BPH-induced hematuria; hematuria was immediately stopped, and the patient reported symptomatic improvement of his BPH symptoms. These researchers also found that prostate size was reduced by 52% and 62% of the initial size at five-month and 12month follow-up, respectively. Carnevale 2010 reported positive preliminary results of PAE procedures with microspheres as a primary treatment in two patients with acute urinary retention due to BPH. For elderly patients with symptomatic BPH, PAE can be an alternative treatment performed by a femoral or radial artery

puncture using conscious sedation instead of general anesthesia. This procedure is typically performed on an outpatient basis and usually does not require catheterization unless the patient is experiencing urinary retention (Wang 2015). In preparation for PAE, preoperative computed tomography or magnetic resonance angiography is typically performed to evaluate the pelvic artery anatomy. Digital subtraction angiography of the right and left internal iliac arteries is performed to assess the prostatic blood supply (Martins Pisco 2012). Super-selective microcatheterization and embolization are then performed on the prostatic arteries. Embolization is typically performed to complete stasis (Carnevale 2010; Martins Pisco 2012; Wang 2015). Cone-beam computed tomography can be used not only to help identify all prostatic arteries but also to identify and avoid embolization of vessels feeding adjacent pelvic structures (Wang 2015). Particle embolics are used almost exclusively, with wide variation in the type and size of particles (Carnevale 2010; DeMeritt 2000). Vasodilators to mitigate vasospasm once the prostatic artery is catheterized are also recommended by some researchers to avoid premature stasis (Martins Pisco 2012). Although the major complication rate is low (less than 1%) (Pisco 2016), perineal pain (9.4%), hematuria (9%), and acute urinary retention (7%) are commonly reported as complications of PAE (Feng 2017). The highest prevalence of acute urinary retention amongst the included studies was 28.4% (Wang 2015). Minor complications, such as hematospermia, rectal bleeding, urinary tract infection, inguinal hematoma, and transient urinary frequency are also reported (Feng 2017; Kuang 2017; Pyo 2017; Shim 2017). However, there is inconsistency in the reporting or classification of adverse events.

#### **Prostatic urethral lift**

Prostatic urethral lift (PUL), marketed commercially as UroLift (Teleflex Inc., Pleasanton, CA, USA), has recently become available in several countries and can be performed under local anesthesia with oral or intravenous sedation; it can also be performed in men with blood clotting disorders or in men receiving anticoagulant therapy. It is therefore being proposed and marketed for men at high risk of general anesthesia (Chin 2012; Woo 2012). Typical inclusion criteria for PUL include prostate volume between 20 mL and 70 mL, IPSS of 12 or greater, measured Q<sub>max</sub> of 15 mL/s or less, and PVR of less than 350 mL (McNicholas 2016). The PUL system consists of two single-use components (a delivery device and an implant). The delivery device consists of a handheld pistol grip to which a needle-shaped probe is attached. Each PUL implant consists of a super-elastic nitinol capsular tab, a polyethylene terephthalate monofilament, and a stainless steel urethral end piece. The surgeon inserts the probe into the urethra until it reaches the widest part of the prostatic urethra; a fine needle at the end of the probe then is deployed to secure an implant in a lobe of the prostate (McNicholas 2016). One end of the implant is anchored in the urethra, and the other is attached to the firm outer surface of the prostatic capsule, thus pulling the prostatic lobe away from the urethra. This is repeated on the other lobe of the prostate. Systematically, four implants for PUL are delivered — two each to the right and left lateral lobes of the prostate (at the 2 o'clock and 10 o'clock positions, distally, from approximately 1.5 cm distal to the bladder neck). PUL generally is not used to treat a hypertrophied median lobe of the prostate, which causes obstructive intravesical protrusion of the prostate (McNicholas 2016); however, a recent small observational study indicated that this might be feasible and effective (Rukstalis 2019). Mild adverse events, such as transient

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

#### Temporary implantable nitinol device

static urine (Chin 2012; Woo 2012).

The temporary implantable nitinol device (TIND), commercially marketed as Medi-Tate (Medi-Tate Ltd., Hadera, Israel), is a novel device that aims to provide prostatic patency. This new minimally invasive procedure can be performed in an outpatient setting under light sedation. The device is placed inside the prostatic urethra via cystoscopy and is expanded upon release (Porpiglia 2015), reshaping the bladder neck and the prostatic urethra. No catheterization is required. The 50-mm-long, 33-mm-diameter device comprises three elongated struts and an anchoring leaflet - all made of nitinol, a biocompatible super-elastic shape memory alloy (Porpiglia 2015). The device is removed 5 days after placement in an outpatient setting under local anesthesia (lidocaine gel) with retraction via a cytoscope.

A single-arm multi-center observational study with 32 participants indicated that median IPSS scores decreased from 19 at baseline to 10 at three-week follow-up and to 9 at 12-month follow-up. Four patients suffered short-term complications (urinary incontinence, urinary retention, urinary tract infection, and prostatic abscess) (Porpiglia 2015). A three-year follow-up indicated that IPSS scores reached a median of 12, and no further complications were reported (Porpiglia 2018).

A second-generation TIND device (iTIND) with structural differences is currently available. Only three struts are used, and the upper part of the device allows action exerted on the urethral mucosa at the level of the bladder neck, with potential avoidance of bladder mucosal injury (Bertolo 2018). A single-arm multi-center observational study evaluating iTIND on 81 participants indicated that mean IPSS scores decreased from 22.5 ± 5.6 at baseline to 11.7  $\pm$  8.0 at 1-month follow-up and to 8.8  $\pm$  6.4 at 12-month follow-up. Only mild complications were reported: haematuria (12.3%), micturition urgency (11.1%), pain (9.9%), dysuria (7.4%), urinary tract infection (6.2%), and urinary retention (9.9%). Only one participant required re-intervention in the form of TURP (Porpiglia 2019). At least two ongoing randomized controlled trials are evaluating this treatment (Bertolo 2018). Newer devices, such as the XFLO Expander system, have been tested in pilot studies, with promising results (Woo 2020).

#### Transurethral microwave thermotherapy

Transurethral microwave thermotherapy (TUMT) uses microwaveinduced heat to ablate prostatic tissue and is designed to have fewer major complications than TURP (Walmsley 2004). The patient is treated in an outpatient setting. Once the patient's bladder is emptied by straight catheterization, a local lidocaine gel is inserted for local anesthesia. The treatment catheter is then placed within the urethra, and this is confirmed by return of the sterile water and by transabdominal or transrectal ultrasound; then, the balloon is inflated. The catheter is composed of a curved tip, a temperature sensor, and a microwave unit. The distal port contains the bladder balloon, allowing for urine drainage and cooling. A rectal probe may be inserted and can be used to monitor rectal temperature (Rubeinstein 2003).

TUMT has evolved over the past decades. The first systems worked at lower energy or heat settings, and treatment would take around an hour with minimal discomfort; however, results were disappointing. Subsequent systems incorporated catheters that provided urethral cooling, thus allowing higher energy delivery. These advancements reduced the procedure time to around 30 minutes and improved outcomes. However, higher energy leads to greater discomfort during the procedure, for which patients often require sedation and analgesia and presents a risk for urinary retention (EAU 2021; Walmsley 2004).

#### How the intervention might work

#### Convective radiofrequency water vapor therapy

The Rezūm system directly transfers targeted and controlled convective thermal energy doses to the transition zone of the prostate gland to treat BPH by using sterile water vapor through tissue interstitial spaces between cells releases its stored thermal energy to create apoptosis and necrosis when in contact with hyperplastic prostatic tissue (Aoun 2015). Reportedly, no thermal effects are seen beyond the confines of the prostate, thereby leaving the urethra, bladder neck, and external sphincter unaffected (Aoun 2015; Woo 2017). In comparison, conductive ablation therapy can cause necrosis of surrounding tissues as higher temperatures and longer heating periods are required to achieve therapeutic effects (Woo 2017).

#### Prostatic arterial embolization

The underlying mechanism of PAE is the ischemia or hypoxia that induces apoptosis, necrosis, sclerosis, and prostatic shrinkage with cystic transformation of part, or all, of the gland, resulting in a softer gland with reduced compression of the urethra (DeMeritt 2000; Sun 2008). In addition, PAE may decrease the plasma concentration of free testosterone that enters prostate cells, thereby lowering dihydrotestosterone levels in the prostate. This may result in the secondary inhibition of prostate growth (Sun 2008). Ischemia or hypoxia may induce prostate cell death and necrosis with a decreased number of some receptors, such as alpha-adrenergic receptors. Therefore, the neuromuscular tone may decrease, resulting in improved clinical symptoms associated with the dynamic pathological component of BPH (Zlotta 1997).

#### **Prostatic urethral lift**

The fundamental idea of PUL consists of the separation and distraction of enlarged prostatic tissue by a series of implants. The PUL system uses adjustable, permanent implants to hold excess prostatic tissue out of the way, thereby opening the narrowed urethra without cutting or removing enlarged prostatic tissue (McNicholas 2016). These implants are shaped as a double-ended hook and aim to expand the opening of the urethra (McNicholas 2016).

#### Temporary implantable nitinol device

The fundamental principle of the TIND device involves 'reshaping' the prostatic urethra and bladder neck, thereby reducing urinary flow obstruction (Porpiglia 2015). This may be caused by the radial force of sustained expansion of the TIND device, causing ischemic

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Cochrane Library

Trusted evidence. Informed decisions. Better health.

necrosis of the tissue and leading to incision to the bladder neck and prostatic urethra.

#### Transurethral microwave thermotherapy

TUMT uses a special transurethral catheter that transmits heat into the prostate via electromagnetic radiation of microwaves, penetrating water-rich tissue. Energy transferred by the microwave to the tissue in the form of heat induces coagulation necrosis, reducing prostatic volume. This mechanism may also cause denervation of receptors, decreasing the smooth muscle tone of the prostatic urethra (Walmsley 2004). Temperatures lower than 45° C seem ineffective in causing this effect; therefore, higher-energy devices were developed to reach temperatures greater than 70° C, causing thermoablation of the prostatic tissue (Aoun 2015).

#### Why it is important to do this review

The Cochrane Urology Group has developed four reviews of studies comparing each MIT to TURP and other therapies (Franco 2021; Jung 2017; Jung 2019; Kang 2020); however, these reviews found few head-to-head comparisons. A recent systematic review and network meta-analysis evaluated surgical therapies for BPH, but it covered only invasive therapies such as different forms of TURP and laser ablation (Huang 2019). We found no systematic review and network meta-analysis to date that has used the same rigorous methods used in a Cochrane Review, which includes applying the GRADE approach and focusing on patient-important outcomes (Guyatt 2008). A network meta-analysis could improve the precision of estimates for each pair-wise comparison, create estimates for which no head-to-head trial was found, and provide a ranking of available interventions (Chaimani 2021). In contemporary practice, with the availability of numerous MITs to treat BPH, the findings of this Cochrane Review are expected to be relevant to policymakers, healthcare providers, and patients.

#### OBJECTIVES

#### Primary

Our primary objective was to assess the comparative effectiveness of minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia through a network metaanalysis.

#### Secondary

To obtain an estimate of relative ranking of these minimally invasive treatments according to their effects.

# METHODS

#### Criteria for considering studies for this review

#### **Types of studies**

We included parallel-group randomized controlled trials (RCTs) only to avoid threatening the transitivity assumption. We excluded cross-over and cluster trials, as these study designs are not relevant in this setting. We excluded single-armed studies, quasi-randomized trials, and observational studies. We included RCTs regardless of their publication status or the language of publication.

#### **Types of participants**

We defined the eligible patient population as men over the age of 40 years with a prostate volume of 20 mL or greater (as assessed by DRE, ultrasound, and/or cross-sectional imaging) with LUTS (determined by an IPSS of 8 or over), and a maximal urinary flow rate ( $Q_{max}$ ) less than 15 mL/s (as measured by non-invasive uroflowmetry, invasive pressure flow studies, or both) (Dunphy 2015; EAU 2021; McNicholas 2016; McVary 2011). The age limitation for this review was based on the observation that the prevalence of BPH is increased in middle-aged and older men and that BPH is infrequent in younger men (Barry 1997; EAU 2021; Egan 2016). If these inclusion criteria had not been fully described, we would have performed a sensitivity analysis (see Sensitivity analysis).

We excluded trials of men with active urinary tract infection; bacterial prostatitis; chronic renal failure; untreated bladder calculi or large diverticula; prostate cancer; urethral stricture disease; or prior prostate, bladder neck, or urethral surgery. We excluded studies of men with other conditions that affect urinary symptoms, such as neurogenic bladder due to spinal cord injury, multiple sclerosis, or central nervous system disease.

We assessed the transitivity assumption by comparing the characteristics of participants and the distribution of potential effect modifiers, including age, prostate volume, and severity of LUTS.

#### **Types of interventions**

We included the following interventions.

#### Experimental interventions (decision set)

- CRFWVT
- PAE
- PUL
- TIND
- TUMT

#### Comparator interventions (supplementary set)

- Sham control (or no intervention)
- TURP (monopolar or bipolar)

#### Comparisons

We predefined the structure of the network and its nodes in our protocol (Franco 2020). We included trials comparing experimental interventions versus comparator interventions or performing head-to-head comparisons between experimental interventions (the representation of each network is embedded in the figure accompanying the main outcomes of the review in the section Effects of interventions). We did not include the comparison of TURP versus sham control because our primary interest is the comparative effectiveness of minimally invasive treatments compared to TURP. Participants in the network could in principle be randomized to any of the methods being compared, and we verified this by comparing characteristics of study design, participants, interventions, and comparisons (Salanti 2012) while considering potential sources of clinical heterogeneity and effect modification (see Subgroup analysis and investigation of heterogeneity).

Copyright © 2021 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

#### Types of outcome measures

We did not use measurement of the outcomes assessed in this review as an eligibility criterion.

#### **Primary outcomes**

- Urological symptom scores
- Quality of life
- Major adverse events

#### Secondary outcomes

- Retreatment
- Erectile function
- Ejaculatory function
- Minor adverse events
- Acute urinary retention
- Indwelling urinary catheter

#### Method and timing of outcome measurement

We considered clinically important differences for all outcomes as the basis for rating the certainty of the evidence for imprecision in the 'Summary of findings' tables (Jaeschke 1989; Johnston 2013).

#### Urological symptom scores

- Mean change measured as IPSS (also known as the AUA Symptom Index) or other validated scores (such as Madsen-Iversen symptom scores). The latter would not be included in a network meta-analysis (see Measures of treatment effect).
- We considered an improvement in IPSS score of 3 points as a minimal clinically important difference (MCID) to assess the efficacy and comparative effectiveness (Barry 1995). If possible, we used different thresholds of MCID based on the severity of IPSS, with a threshold of 3 for mild LUTS, 5 for moderate LUTS, and 8 for severe LUTS (Barry 1995).

#### Quality of life

- Mean change measured as IPSS-quality of life.
- No formal threshold was established for IPSS-quality of life. We used an MCID of 1 to assess the efficacy and comparative effectiveness (Brasure 2016; Rees 2015).

#### Major adverse events

- Examples include postoperative hemorrhage requiring admission or intervention.
- We used the Clavien-Dindo classification system to assess surgical complications and categorized Grade III, IV, and V complications as major (Dindo 2004).
- Based on Guyatt 2011a, we considered a 25% relative change as the threshold for a clinically important difference.

#### Retreatment

- Events requiring other surgical treatment modalities (e.g. TURP) after an intervention. We considered the first retreatment and accounted for repetitive events in a narrative synthesis.
- Based on Guyatt 2011a, we considered a 25% relative change as the threshold for a clinically important difference.

#### **Erectile function**

- Mean change, measured as the total score on the International Index of Erectile Function (IIEF)-5 questionnaire (also known as the Sexual Health Inventory for Men) (Rosen 1997).
- We considered a difference in IIEF-5 over 5 points as the MCID (Spaliviero 2010).

#### **Ejaculatory function**

- Mean change, measured on the Male Sexual Health Questionnaire for Ejaculatory Dysfunction (MSHQ-EjD) (Rosen 2007).
- We used an MCID of 25% improvement from baseline on the MSHQ-EjD for ejaculatory function (Nickel 2015).

#### **Minor adverse events**

- Examples include postoperative fever or pain requiring medication.
- We used the Clavien–Dindo classification system to assess surgical complications and categorized Grade I and II complications as minor (Dindo 2004).
- Based on Guyatt 2011a, we considered a 25% relative change as the threshold for a clinically important difference.

#### Acute urinary retention

- Events requiring catheterization after intervention.
- Based on Guyatt 2011a, we considered a 25% relative change as the threshold for a clinically important difference.

#### Indwelling urinary catheter

- Proportion of participants with an indwelling catheter at postoperative 24 hours.
- Based on Guyatt 2011a, we considered a 25% relative change as the threshold for a clinically important difference.

We considered outcomes measured up to 12 months after randomisation as short-term and those later than 12 months as long-term, for urological symptom scores, quality of life, retreatment, erectile function, ejaculatory function, minor adverse events, and acute urinary retention. We assessed major adverse events including short-term and long-term data and indwelling urinary catheter over the short term only.

The selection of patient-important outcomes was based on the input of the clinical authors and their day-to-day practice; we did not formally involve men with BPH symptoms.

#### Main outcomes for 'Summary of findings' tables

We presented 'Summary of findings' tables reporting the following outcomes listed according to priority.

- Urological symptom scores
- Quality of life
- Major adverse events
- Retreatment
- Erectile function
- Ejaculatory function

## Search methods for identification of studies

We performed a comprehensive search with no restrictions on language of publication or publication status.

#### Electronic searches

We retrieved relevant studies from existing Cochrane Reviews for each individual treatment (Franco 2021; Jung 2017; Jung 2019; Kang 2020). We updated searches for each of the individual Cochrane Reviews assessing each minimally invasive treatment. We performed a comprehensive search for TIND from the inception of each of the following databases (see Appendix 1).

- Cochrane Library via Wiley (from inception until 24 February 2021)
  - Cochrane Database of Systematic Reviews
  - Cochrane Central Register of Controlled Trials
  - Database of Abstracts of Reviews of Effects
  - Health Technology Assessment Database
- MEDLINE via Ovid (from 1946 until 24 February 2021)
- Embase via Elsevier (from 1974 until 24 February 2021)
- Scopus (from 1966 until 24 February 2021)
- Web of Science (from 1900 until 24 February 2021)
- Latin American and the Caribbean Health Sciences Literature (LILACS; www.bireme.br/, from 1982 until 24 February 2021)

We also searched the following on 24 February 24 2021.

- ClinicalTrials.gov at the US National Institutes of Health (www.clinicaltrials.gov/)
- World Health Organization (WHO) International Clinical Trials Registry Platform search portal (apps.who.int/trialsearch/)
- Grey literature repository from the current Grey Literature Report (www.greylit.org/)

#### Searching other resources

We tried to identify other potentially eligible trials and ancillary publications by searching the reference lists of retrieved included trials, reviews, meta-analyses, and health technology assessment reports. We contacted the study authors of included trials to identify further studies that we may have missed. We contacted drug/device manufacturers for ongoing or unpublished trials. We searched abstract proceedings of relevant meetings of the American Urological Association, the European Association of Urology, and the International Continence Society for 2018 to 2020 for unpublished studies (see Appendix 2).

#### Data collection and analysis

#### **Selection of studies**

We used Covidence to identify and remove potential duplicate records. Two review authors (JVAF, LG) scanned abstracts, titles, or both to determine which studies should be assessed further using the same software. Two review authors (JVAF, LG) investigated all potentially relevant records as full text, mapped records to studies, and classified studies as included studies, excluded studies, studies awaiting classification, or ongoing studies following the criteria for each provided in the *Cochrane Handbook for Systematic Reviews of Interventions* (Higgins 2021). We resolved any discrepancies through consensus or recourse to a third review author (PD). We

documented the reasons for exclusion. We presented a PRISMA flow diagram showing the process of study selection (Page 2021).

#### Data extraction and management

We developed a dedicated data abstraction form that we pilottested ahead of time. Because we retrieved relevant studies from existing Cochrane Reviews for each individual treatment for which study characteristics, outcome data, and risk of bias assessments were done by members of our review team (Franco 2021; Jung 2017; Jung 2019; Kang 2020), the following sections apply only to new studies identified by our search methods.

For studies that fulfilled inclusion criteria, two review authors (of JVAF, LG, and JHJ) independently abstracted the following information.

- Study design
- Study dates
- Study settings and country
- Participant inclusion and exclusion criteria (e.g. age, baseline IPSS)
- Participant details, baseline demographics (e.g. age, prostate size, IPSS)
- Numbers of participants by study and by study arm
- Details of relevant experimental intervention (e.g. size of the cystoscope, energy-generating device, embolization agent, delivery device) and comparator intervention (e.g. monopolar versus bipolar energy, specifications of the sham procedure)
- Definitions of relevant outcomes and methods (e.g. type of instrument, such as IPSS) and timing of outcome measurement (e.g. in months), as well as relevant subgroups (e.g. based on age, prostate volume, the severity of LUTS)
- Study funding sources
- · Declarations of interest by primary investigators

We extracted outcome data relevant to this Cochrane Review as needed for the calculation of summary statistics and measures of variance. For dichotomous outcomes, we presented numbers of events and totals for populations in a  $2 \times 2$  table, as well as summary statistics with corresponding measures of variance. For continuous outcomes, we obtained the means and standard deviations or data necessary to calculate this information.

We resolved any disagreements by discussion or, if required, by consultation with a third review author (PD).

In tables, we provided information about potentially relevant studies, including the trial identifiers.

We contacted the authors of included studies to obtain key missing data as needed.

#### Dealing with duplicate and companion publications

In the event of duplicate publications, companion documents, or multiple reports of a primary study, we maximized the yield of information by mapping all publications to unique studies and collating all available data. We used the most complete data set aggregated across all known publications. In case of doubt, we gave priority to the publication reporting the longest follow-up associated with our primary or secondary outcomes.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Copyright © 2021 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

#### Assessment of risk of bias in included studies

Two review authors (JVAF and LG) independently assessed the risk of bias of each included study. We resolved disagreements by consensus or by consultation with a third review author (PD). We presented a 'Risk of bias' summary figure to illustrate these findings. We further summarized the risk of bias across domains for each outcome in each included study, as well as across studies and domains, for each outcome in accordance with the approach for summary assessments of risk of bias presented in the *Cochrane Handbook for Systematic Reviews of Interventions* (Higgins 2011).

#### Assessment of risk of bias in randomized controlled trials

We assessed the risk of bias using Cochrane's 'Risk of bias' assessment tool (Higgins 2011). We assessed the following domains.

- Random sequence generation (selection bias)
- Allocation concealment (selection bias)
- Blinding of participants and personnel (performance bias)
- Blinding of outcome assessment (detection bias)
- Incomplete outcome data (attrition bias)
- Selective reporting (reporting bias)
- Other sources of bias

We judged the risk of bias domains as 'low risk', 'high risk', or 'unclear risk' and evaluated individual bias items as described in the *Cochrane Handbook* (Higgins 2011).

For selection bias (random sequence generation and allocation concealment), we evaluated the risk of bias at the trial level. For performance bias (blinding of participants and personnel), we considered all outcomes similarly susceptible to performance bias. For detection bias (blinding of outcome assessment), we grouped outcomes as susceptible to detection bias (subjective) or not susceptible to detection bias (objective) outcomes.

We defined the following endpoints as subjective outcomes.

- Urological symptom scores
- Quality of life
- Major adverse events
- Erectile function
- Ejaculatory function
- Minor adverse events

We defined the following endpoints as objective outcomes.

- Retreatment
- Acute urinary retention
- Indwelling urinary catheter

We considered studies that compared MITs to TURP to be unblinded (at high risk of performance bias and detection bias for subjective outcomes). Studies that compared MITs to sham treatments and aimed to blind participants were considered at low risk of detection bias and also performance bias if personnel were also blinded. We assessed attrition bias (incomplete outcome data) on an outcomespecific basis, and we presented the judgement for each outcome separately when reporting our findings in 'Risk of bias' tables. For reporting bias (selective reporting), we evaluated the risk of bias at a trial level.

#### **Measures of treatment effect**

#### Relative treatment effect

We expressed dichotomous data as risk ratios (RRs) with 95% confidence interval (CIs) to enhance the interpretability of results. We expressed continuous data as mean differences (MDs) with 95% CIs. We prioritized post-intervention over change from baseline measurements. We anticipated that different scales might be used for urological symptom scores (e.g. Madsen symptom score in few older studies), in which case we included outcome data using the preferred scale for this outcome (i.e. IPSS) in order to preserve the transitivity of the network. In the presence of binary and continuous data for the same outcome, we performed analysis for continuous data. If this was not possible due to network geometry, we performed analysis for binary data.

#### Relative treatment ranking

We obtained a treatment hierarchy using P scores for all outcomes of the review (Rücker 2015). P scores allow describing the mean extent of certainty that the underlying treatment effect is larger than that of any other intervention.

#### Unit of analysis issues

The unit of analysis was the individual participant. When multiple trial arms are reported in a single trial, we included only the arms with comparisons relevant to prespecified nodes in our network.

#### Dealing with missing data

We obtained missing data (e.g. missing standard deviations) from study authors and performed intention-to-treat analyses if data were available. We investigated attrition rates (e.g. dropouts, losses to follow-up, withdrawals) and critically appraised issues of missing data. We did not impute missing data.

#### Assessment of heterogeneity

#### Network meta-analysis

#### Assessment of the transitivity assumption

Before conducting a network meta-analysis, we assessed the transitivity assumption. Network meta-analysis rests on the assumption of transitivity, that is, that effect modifiers have a comparable distribution across treatment comparisons in a network (Cipriani 2013; Jansen 2013). To assess the plausibility of this assumption, we visually inspected the comparability of distributions of age, prostate volume, and urological symptom score severity (IPSS), the time point of outcome assessment, and risk of bias (randomization, allocation concealment, and blinding to the risk of bias) as potential treatment effect modifiers across comparisons (Salanti 2014). We assessed the similarity of inclusion and exclusion criteria of all studies, including participants, treatments, and outcomes, to evaluate whether they impacted treatment effects.

#### Assessment of statistical consistency

Lack of transitivity in a network can threaten the validity of the consistency assumption, that is, the statistical agreement between direct and indirect evidence (Caldwell 2005; Lu 2004).

Results can be misleading in the presence of inconsistency in the network. We evaluated the presence of inconsistency both locally and globally. We evaluated each network locally using the loop-specific method by generating an inconsistency factor along with a 95% CI for each closed-loop (Veroniki 2013). This way, we identified which piece of evidence would be responsible for inconsistency, and we explored this further. We also applied a global assessment for consistency in each network by applying the design-by-treatment interaction model (White 2012a). It has been shown that inconsistency tests have low power to detect true inconsistency (Song 2012; Veroniki 2014). Hence, we assessed transitivity even in the absence of evidence for inconsistency. If inconsistency was found, we followed the guidance provided in the *Cochrane Handbook* (Section 11.4.4.4; Chaimani 2021).

#### Pair-wise meta-analysis

We identified heterogeneity through visual inspection of forest plots to assess the overlap of CIs and the  $I^2$  statistic, which quantifies between-study variation across studies, to assess the impact of heterogeneity on the meta-analysis (Higgins 2002; Higgins 2003). We interpreted the  $I^2$  statistic as follows (Deeks 2021).

- 0% to 40%: may not be important.
- 30% to 60%: may indicate moderate heterogeneity.
- 50% to 90%: may indicate substantial heterogeneity.
- 75% to 100%: considerable heterogeneity.

We also used Cochran's Q test to assess for heterogeneity of estimated effect sizes from individual studies. However, we cautiously interpreted these results considering both the low power to detect true heterogeneity when the number of studies is small and the excessive power needed to detect negligible heterogeneity when the number of studies is high (Huedo-Medina 2006; Pereira 2010).

#### Assessment of reporting biases

We attempted to obtain study protocols to assess for selective outcome reporting.

We used comparison-adjusted funnel plots to assess small-study effects (Chaimani 2013). Several explanations can be offered for the asymmetry of a funnel plot, including true heterogeneity of effect with respect to trial size, poor methodological design (and hence bias of small trials), and publication bias. We, therefore, interpreted these results carefully.

#### **Data synthesis**

#### Methods for indirect and network comparisons

We fitted a random-effects network meta-analysis model because we anticipated methodological and clinical heterogeneity across studies. We assumed a common within-network heterogeneity estimate across comparisons, and we estimated this using the restricted maximum likelihood (REML) method (Veroniki 2016). This is a reasonable assumption, given that all treatments included in the network are of the same nature. An advantage of this approach is that treatment comparisons informed by a single study can borrow strength from the rest of the studies in the network (Higgins 1996; Salanti 2008). Each network meta-analysis treatment effect estimate was presented along with a 95% CI and a 95% predictive interval (PrI) with reference to the standard treatment (TURP). A PrI is an interval within which the treatment effect estimate of a future study is expected to lie, accounting for both the uncertainty of the treatment effect and between-study variance estimates (Higgins 2009; Riley 2011). We conducted a network meta-analysis using the network suite of commands in Stata (STATA 2019; White 2012; White 2015).

#### Relative treatment ranking

We estimated the ranking probabilities that all treatments would be at each possible rank for each intervention. We used the surface under the cumulative ranking curve (SUCRA) to rank the effectiveness and safety of minimally invasive interventions (Salanti 2011). SUCRA accounts for both effect size magnitude and uncertainty around the underlying effect size. We displayed results (network plot, SUCRA plots and league table) using the 'network graph package' in Stata (STATA 2019; Chaimani 2015).

#### Methods for direct treatment comparisons

We performed analyses according to recommendations provided in Chapter 9 of the *Cochrane Handbook* (Deeks 2021), and we used Cochrane's statistical software, Review Manager 5 (Review Manager 2014), for analysis. When possible, we performed these standard pair-wise meta-analyses using a random-effects model because we anticipated methodological and clinical heterogeneity across studies. We calculated corresponding 95% CIs for all analyses, and we graphically presented the results using forest plots. When trials were clinically too heterogeneous to be combined, we performed only subgroup analyses without calculating an overall estimate. In order to avoid duplication with the supporting reviews of this network meta-analysis, we described only the pairwise comparisons for the data that could not be included in the network due to concerns about transitivity.

#### Subgroup analysis and investigation of heterogeneity

When we find important heterogeneity and/or inconsistency, we explored possible sources for primary outcomes. When sufficient studies are available, we performed subgroup analysis by using the following potential effect modifiers as possible sources of inconsistency and/or heterogeneity.

- Patient age (younger than 65 years versus 65 years and older).
- Prostate volume (≤ 40 mL or > 40 mL).
- Severity of LUTS based on IPSS (score ≤ 19 (moderately symptomatic) versus > 19 (severely symptomatic)).

These subgroup analyses are based on the following observations.

- Age is a well-known risk factor for BPH surgery. Older people have a higher rate of postoperative complications compared with younger people (Bhojani 2014; Pariser 2015). The age cutoff is based on the WHO definition of old age (WHO 2002).
- Outcomes and complications of minimally invasive procedures, such as TURP, correlate with prostate volume (Reich 2008). Prostate volume cut-off greater than 40 mL is based on this being the most commonly used threshold to distinguish 'small' from 'large' for the indication of treatment with a 5-alpha reductase inhibitor (EAU 2021).
- The relationship between changes in IPSS scores and patient global ratings of improvement is influenced by baseline scores (Barry 1995).

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

We planned to perform subgroup analyses limited to the primary outcomes.

#### Sensitivity analysis

We planned to perform sensitivity analyses limited to the primary outcomes to explore the influence of the following factors (when applicable) on effect size.

- Restricting the analysis in RCTs by taking into account risk of bias, by excluding studies at 'high risk' or 'unclear risk' (studies with at least one domain at 'high risk' or 'unclear risk' of bias for the analyzed outcome).
- Restricting the analysis to RCTs with adequately described inclusion criteria (prostate size, age, IPSS value, and Q<sub>max</sub>).

# Summary of findings and assessment of the certainty of the evidence

We used 'Summary of findings' tables to summarize key results of the review, using the Confidence in Network Meta-analysis (CINeMA) framework and software (Chaimani 2021; CINeMA 2017; Salanti 2014). We included the following outcomes.

- Urological symptom scores
- Quality of life
- Major adverse events
- Retreatment
- Erectile function
- Ejaculatory function

Our reference for the network meta-analysis was TURP, considering that it is the reference treatment for all minimally invasive procedures. We used the five GRADE criteria (study limitations, consistency of effect, imprecision, indirectness, and publication bias) to evaluate the quality of the body of evidence as it relates to studies that contributed data to the meta-analysis for each prespecified outcome (Guyatt 2008). Two review authors (JVAF and LG) independently made judgments about the certainty of the evidence (high, moderate, low, or very low) and resolved disagreements by discussion or consultation with a third review author (PD). We created a 'Summary of findings' table for each outcome, using the approach presented by Yepes-Nuñez 2019.

# RESULTS

#### **Description of studies**

Details of the included studies are presented in Characteristics of included studies and Table 1.

#### **Results of the search**

We retrieved 26 studies from the previous Cochrane reviews.

- Seven studies (18 reports) from the PAE review (Jung 2020) last updated on 28 September 2020
- One study (17 reports) from the CRFWVT (Rezūm) review (Kang 2020) last updated on 30 October 2020
- Two studies (28 reports) from the PUL (UroLift) review (Jung 2019) last updated on 28 October 2020
- 16 studies (37 reports) from the TUMT review (Franco 2021) last updated on 31 May 2021

For the TIND search, we identified 469 records from electronic databases. We found no relevant records in the grey literature repository. After removing duplicates, we screened the titles and abstracts of the remaining 339 records, 331 of which we excluded. We assessed eight full-text articles, and we excluded six records for various reasons. Finally, we included one study (two reports) in this review for this intervention. There were no ongoing studies for this intervention that met the inclusion criteria or were relevant to the review question. We have shown the flow of literature through the assessment process in the PRISMA flowchart (Figure 1).

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

#### Figure 1. PRISMA 2020 flow diagram

#### Included studies

#### Study design and sample size

We included 27 trials with 3017 randomized participants. Their median sample size was 103 (interquartile range 61-155).

#### Setting

The studies were conducted usually in tertiary hospitals, mostly in Europe, the USA and Canada, except for four PAE trials in China, Brazil, and Egypt. Most of the TUMT trials were conducted between 1991 and 1999, whereas the other interventions (CRFWVT, PUL, PAE, and TIND) took place between 2007 and 2018.

#### **Participants**

Most studies included men over 45 to 50 years old with moderate LUTS refractory to medical treatment; with a  $Q_{max}$  < 12/15 mL/s, a voided volume  $\geq$  125 mL and a prostate volume between 30/100 g to 60/100 g. Participants were usually screened for prostate cancer and infection, among other comorbidities, before inclusion.

#### Interventions and comparisons

We included trials with the following interventions and comparisons.

- CRFWVT versus sham treatment (McVary 2016)
- PAE versus sham treatment (Pisco 2020) •
- PAE versus TURP (Abt 2018; Carnevale 2016; Gao 2014; Insausti 2020; Radwan 2020; Zhu 2018)
- PUL versus sham treatment (Gratzke 2017)
- PUL versus TURP (Roehrborn 2013) •

- TIND versus sham treatment (Chughtai 2020)
- TUMT versus sham treatment (Abbou 1995; Albala 2002; Bdesha 1994; Blute 1996; Brehmer 1999; De Wildt 1996; Larson 1998; Nawrocki 1997; Roehrborn 1998; Venn 1995)
- TUMT versus TURP (Ahmed 1997; D'Ancona 1998; Dahlstrand 1995; Floratos 2001; Norby 2002; Wagrell 2002)

#### Outcomes

Most trials reported the primary outcomes of our review: urologic symptoms scores and quality of life (measured by IPSS and IPSS-QoL) and major adverse events. Older trials assessing TUMT included other scales such as the Madsen-Iversen symptom score, which is thoroughly described in one of our supporting reviews (Franco 2021). Retreatment rates were mostly reported narratively, and we had to analyze which ones constituted retreatment as defined in our review or retreatment as a major adverse event (i.e. retreatment due to a complication). Ejaculatory function and erectile function were usually reported in a subset of sexually active participants, contributing to the risk of bias due to attrition. We extracted both the IIEF-5/IIEF scale and the MSHQ-EjD scale, but since they were not consistently reported across studies, we also extracted data on the incidence of sexual dysfunction (i.e. erectile dysfunction and ejaculatory problems), for which we present the analysis using the continuous and dichotomous data. Other outcomes such as minor adverse events and acute urinary retention were also poorly reported across studies. The duration of indwelling urinary catheterization was only reported in two studies and described narratively as subsidiary to acute urinary retention.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

#### Funding

Fourteen studies did not state their funding sources (Ahmed 1997; Albala 2002; Bdesha 1994; Blute 1996; Brehmer 1999; Carnevale 2016; D'Ancona 1998; Dahlstrand 1995; De Wildt 1996; Floratos 2001; Gao 2014; Radwan 2020; Venn 1995; Zhu 2018), nine studies were funded by the manufacturers or sponsors of the procedure (Chughtai 2020; Gratzke 2017; Insausti 2020; Larson 1998; McVary 2016; Pisco 2020; Roehrborn 1998; Roehrborn 2013; Wagrell 2002) and four studies were funded by public institutions or hospitals (Nawrocki 1997; Norby 2002; Abbou 1995; Abt 2018).

#### **Excluded studies**

For TIND we excluded two single-arm studies (Porpiglia 2015; Porpiglia 2019), one case series (Lim 2011), and one study assessing the wrong intervention (Yachia 1996). For PUL we excluded a singlearm study (Gratzke 2018). For PAE we excluded five studies due to a wrong study design (Bagla 2017; Brown 2018; NCT01835860; Pereira 2018; Qiu 2017). Another study was excluded due to wrong comparison (PAE versus simple prostatectomy, Russo 2015). Another report was a letter to the editor (Bilhim 2015). For CRFWVT we excluded one educational lecture from a conference (Woo 2018). For TUMT, we excluded 22 studies for the following reasons: two studies addressed transrectal thermotherapy (Zerbib 1992; Zerbib 1994; Albala 2000), three studies provided economic data on published trials (Kobelt 2004; Norby 2002b; Waldén 1998), two were cross-over studies with insufficient data (Albala 2000; Tan 2005), nine were observational studies and other nonrandomized comparisons (Arai 2000; D'Ancona 1997; Hahn 2000; Hansen 1998; Mulvin 1994; Ohigashi 2007; Servadio 1987; Trock 2004; Vesely 2006), two were review articles identified through full-text assessment (Dahlstrand 2003; Nørby 2004), three had an ineligible comparison (Djavan 1999; Schelin 2006; Shore 2010) and one was a terminated study (ISRCTN23921450).

#### **Ongoing trials**

We have identified six ongoing trials assessing the effects of PAE (ACTRN12617001235392; NCT02006303; NCT02566551; NCT04236687) and PUL (NCT04178811; NCT04338776).

#### **Risk of bias in included studies**

See Characteristics of included studies for a full description of the risk of bias assessment by study and outcome.

#### Allocation

#### Random sequence generation

We identified 14 studies that adequately described the random sequence generation (mostly using electronic systems, random numbers tables, random permuted blocks) and were rated as having a low risk of bias (Abbou 1995; Abt 2018; Blute 1996; Chughtai 2020; Gao 2014; Gratzke 2017; Insausti 2020; McVary 2016; Nawrocki 1997; Pisco 2020; Roehrborn 1998; Roehrborn 2013; Venn 1995; Zhu 2018). The remaining studies were rated as unclear risk of bias as they did not provide sufficient information for judgement.

#### Allocation concealment

We rated eight studies as having a low risk of bias, mostly by using a centralized allocation using software (Abt 2018; Blute 1996; Chughtai 2020; Gratzke 2017; McVary 2016; Pisco 2020; Roehrborn 1998; Roehrborn 2013). Two studies used inadequate methods to conceal allocation or had evidence of possible tampering of the process (Ahmed 1997; Nawrocki 1997). The remaining studies were rated as having an unclear risk of bias due to a lack of information on the allocation method.

#### Blinding

#### Blinding of participants and personnel

#### Minimally invasive treatments versus sham treatment

While the eight studies were rated as low risk of bias due to blinding of participants and personnel (Blute 1996; Nawrocki 1997; Roehrborn 1998; Abbou 1995; Bdesha 1994; Chughtai 2020; De Wildt 1996; Larson 1998), three studies were rated as high risk of bias due to lack of blinding of study personnel (McVary 2016; Pisco 2020; Roehrborn 2013). Three studies did not adequately describe blinding methods (Albala 2002; Brehmer 1999; Venn 1995).

#### Minimally invasive treatments versus TURP

All 13 studies were judged as having a high risk of bias given lack of assurance of appropriate methods of blinding of participants and personnel considering the nature of the comparison (Abt 2018; Ahmed 1997; Carnevale 2016; D'Ancona 1998; Dahlstrand 1995; Floratos 2001; Gao 2014; Gratzke 2017; Insausti 2020; Norby 2002; Radwan 2020; Wagrell 2002; Zhu 2018).

#### Blinding of outcome assessment

#### Minimally invasive treatments versus sham treatment

- Subjective outcomes (urologic symptom scores, quality of life, major adverse events, erectile function, ejaculatory disorders, and minor adverse events): All 14 studies were considered to be at low risk of bias since participants were blinded (Abbou 1995; Albala 2002; Bdesha 1994; Blute 1996; Brehmer 1999; Chughtai 2020; De Wildt 1996; Larson 1998; McVary 2016; Nawrocki 1997; Pisco 2020; Roehrborn 1998; Roehrborn 2013; Venn 1995)
- Objective outcomes (re-treatment, acute urinary retention, indwelling urinary catheter, and hospital stay): we rated all studies as having a low risk of bias for these outcomes as they were unlikely to be affected by lack of blinding (ascertaining this does not involve judgement)

#### Minimally invasive treatments versus TURP

- Subjective outcomes (urologic symptom scores, quality of life, major adverse events, erectile function, ejaculatory disorders, and minor adverse events): we judged all 13 studies as having a high risk of bias given lack of assurance of appropriate methods of blinding considering the nature of the comparison (Abt 2018; Ahmed 1997; Carnevale 2016; D'Ancona 1998; Dahlstrand 1995; Floratos 2001; Gao 2014; Gratzke 2017; Insausti 2020; Norby 2002; Radwan 2020; Wagrell 2002; Zhu 2018).
- Objective outcomes (retreatment, acute urinary retention, indwelling urinary catheter, and hospital stay): we rated all studies as having a low risk of bias for these outcomes as they were unlikely to be affected by lack of blinding (ascertaining this does not involve judgement).

#### Incomplete outcome data

#### Urologic symptoms score/quality of life

 Short-term follow-up: Six studies were rated as having a high risk of bias due to substantial or unbalanced attrition (Abbou

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

1995; Blute 1996; Chughtai 2020; D'Ancona 1998; Insausti 2020; Larson 1998), four studies were rated as unclear risk of bias due to insufficient information or moderate attrition (Ahmed 1997; Gao 2014; Gratzke 2017; Roehrborn 1998) and the rest of the studies were rated as low risk of bias.

• Long-term follow-up: three studies with a low risk of bias at short-term follow-up suffered important attrition in the long term and were rated as high risk of bias (Abt 2018; Dahlstrand 1995; Wagrell 2002).

#### Major/minor adverse events

Four studies were rated as having a high risk of bias due to substantial or unbalanced attrition (Abbou 1995; Chughtai 2020; D'Ancona 1998; Larson 1998), five studies were rated as unclear risk of bias due to insufficient information or moderate attrition (Ahmed 1997; Blute 1996; Brehmer 1999; Radwan 2020; Roehrborn 1998), and the rest of the studies were rated as low risk of bias.

#### Retreatment

Six studies were rated as having a high risk of bias (Abbou 1995; Chughtai 2020; Dahlstrand 1995; D'Ancona 1998; Larson 1998; Wagrell 2002), and one study was rated as having an unclear risk of bias (Brehmer 1999), and the rest of the studies were rated as low risk of bias.

#### **Erectile function**

We rated four studies as having a high risk of bias (Chughtai 2020; Floratos 2001; Gratzke 2017; McVary 2016) primarily due to the measurement of the outcome in a subgroup of sexually active participants. Three studies were rated as unclear risk of bias (Ahmed 1997; Blute 1996; Roehrborn 1998) and the rest as unclear risk of bias.

#### **Ejaculatory function**

We rated six studies as having a high risk of bias (Chughtai 2020; Floratos 2001; Gratzke 2017; Larson 1998; McVary 2016; Roehrborn 2013) primarily due to the measurement of the outcome in a subgroup of sexually active participants. Three studies were rated as unclear risk of bias (Ahmed 1997; Blute 1996; Roehrborn 1998) and the rest as unclear risk of bias.

#### Acute urinary retention

We rated three studies as having a high risk of bias (Abbou 1995; Chughtai 2020; Larson 1998), three studies with an unclear risk of bias (Albala 2002; Blute 1996; Roehrborn 1998) the rest of the studies as low risk of bias.

#### Indwelling urinary catheter

We rated one study as having a high risk of bias (Abbou 1995). Except for three studies that adequately reported this outcome for nearly all participants (Abt 2018; Gao 2014; McVary 2016), the rest of the studies only included a narrative statement, not fully reporting this outcome.

#### **Selective reporting**

Three studies were rated as high risk of bias due to the selective presentation of data for a single group (active treatment) or for only certain time points, and the definitions of outcomes that did not match the protocol (Albala 2002; Blute 1996; Insausti 2020). Four studies reported their results according to a pre-specified plan and were rated as having a low risk of bias (Gratzke 2017; McVary 2016; Pisco 2020; Roehrborn 2013). The rest of the studies did not provide sufficient information for judgement, mostly due to the lack of a pre-registered or published protocol.

#### Other potential sources of bias

We rated all studies as having low risk of bias as we identified no other sources of bias.

#### **Effects of interventions**

See: Summary of findings 1 Urologic symptoms scores - short term; Summary of findings 2 Quality of life - short term; Summary of findings 3 Major adverse events; Summary of findings 4 Retreatment - long term; Summary of findings 5 Erectile function - short term; Summary of findings 6 Ejaculatory function - short term

# 1. Network meta-analysis: Minimally invasive treatments versus TURP

The geometry of the networks is presented in each of the figures (Figure 2; Figure 3; Figure 4; Figure 5; Figure 6; Figure 7). Considering that the majority of trials assessed the effect of TUMT and PAE, the networks were not densely connected, and in some cases, they were star-shaped with no closed loops (this is discussed in the section Quality of the evidence). The following analyses present data from networks with no concerns on transitivity or global consistency (except in those networks in which it was not possible to assess it due to the lack of closed loops).

Figure 2. Urologic symptoms scores (IPSS). Top left: visual representation of the network. Bottom left: comparisonadjusted funnel plot for the detection of publication bias. We found no important asymmetry in this plot; therefore publication bias is not strongly suspected. Top right panel: forest plot representing the estimates from the network meta-analysis. Bottom right: The surface under the curve (SUCRA) of each of these plots defines the probability that a treatment out of n treatments in a network meta-analysis is the best, the second, the third, and so on until the least effective treatment. CRFWVT: convective radiofrequency water vapor therapy; PAE: prostatic arterial embolization; PUL: prostatic urethral lift; TIND: temporary implantable nitinol device; TUMT: transurethral microwave thermotherapy; TURP: transurethral resection of the prostate.

#### 1.1. Urologic symptoms scores

See Summary of findings 1, Table 2 (league table with the effect estimates) and Figure 2 (forest plot and SUCRA).

Based on 19 studies with 1847 participants (Abt 2018; Ahmed 1997; Bdesha 1994; Blute 1996; Carnevale 2016; Chughtai 2020; D'Ancona 1998; Gao 2014; Gratzke 2017; Insausti 2020; Larson 1998; McVary 2016; Norby 2002; Pisco 2020; Radwan 2020; Roehrborn 1998; Roehrborn 2013; Wagrell 2002; Zhu 2018) PUL and PAE may result in little to no difference in urologic symptoms scores compared to TURP at short-term follow-up (3 to 12 months, MD of IPSS score, range 0 to 35, higher scores indicate worse symptoms; PUL: 1.47, 95% CI -4.00 to 6.93; PAE: 1.55, 95% CI -1.23 to 4.33). CRFWVT, TUMT, and TIND may result in worse urologic symptoms scores compared to TURP at short-term follow-up, but the confidence intervals include little to no difference (CRFWVT: 3.6, 95% CI -4.25 to 11.46; TUMT: 3.98, 95% CI 0.85 to 7.10; TIND: 7.5, 95% CI -0.68 to 15.69). TURP had the highest likelihood of being the most efficacious for this outcome, however, among minimally invasive procedures PUL and PAE were the highest-ranked interventions (See SUCRA plot in Figure 2). The certainty of the evidence is low due to major

concerns about within-study bias, imprecision and inconsistency (heterogeneity, see Table 3).

#### 1.2. Quality of life

See Summary of findings 2, Table 2 (league table with the effect estimates) and Figure 3 (forest plot and SUCRA).

Based on 13 studies with 1469 participants (Abt 2018; Carnevale 2016; Chughtai 2020; Gao 2014; Gratzke 2017; Insausti 2020; Larson 1998; McVary 2016; Pisco 2020; Roehrborn 1998; Roehrborn 2013; Wagrell 2002; Zhu 2018), all interventions (PUL, PAE, CRFWVT, TUMT, TIND) may result in little to no difference in the quality of life scores compared to TURP at short-term follow-up (3 to 12 months; MD of IPSS-QoL score, range 0-6, higher scores indicate worse symptoms; PUL: 0.06, 95% CI -1.17 to 1.30; PAE: 0.09, 95% CI -0.57 to 0.75; CRFWVT: 0.37, 95% CI -1.45 to 2.20; TUMT: 0.65, 95% CI -0.48 to 1.78; TIND: 0.87, 95% CI -1.04 to 2.79). TURP had the highest likelihood of being the most efficacious for this outcome, however, among minimally invasive procedures PUL and PAE were the highest-ranked interventions (See SUCRA plot in Figure 3). The certainty of the evidence is low due to major concerns on within-

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

study bias, imprecision and inconsistency (heterogeneity, see Table 3).

#### 1.3. Major adverse events

See Summary of findings 3, Table 2 (league table with the effect estimates) and Figure 4 (forest plot and SUCRA).

Based on 15 studies with 1573 participants (Abt 2018; Ahmed 1997: Carnevale 2016: Chughtai 2020: D'Ancona 1998: Dahlstrand 1995; Floratos 2001; Gao 2014; Gratzke 2017; Insausti 2020; McVary 2016; Norby 2002; Pisco 2020; Roehrborn 2013; Wagrell 2002) TUMT probably results in a large reduction in major adverse events compared to TURP (RR 0.20, 95% CI 0.09 to 0.43). PUL, CRFWVT, TIND, and PAE may also result in a large reduction in major adverse events, but the confidence interval includes substantial benefits and harms (at 3 to 36 months; PUL: RR 0.30, 95% CI 0.04 to 2.22; CRFWVT: RR 0.37, 95% CI 0.01 to 18.62; TIND: 0.52, 95% CI 0.01 to 24.46; PAE: 0.65, 95% CI 0.25 to 1.68). Furthermore, TUMT has the highest likelihood of being the most efficacious for this outcome while TURP was the lowest-ranked intervention (See SUCRA plot in Figure 4). The certainty of the evidence is low for CRFWVT, TIND, PUL, and PAE due to major concerns on the within-study bias and severe imprecision. The certainty of the evidence for TUMT is moderate due to major concerns on the within-study bias.

The most commonly reported major adverse events included hematuria with blood clots requiring evacuation or transfusion and severe infection. Less frequently and with a delayed presentation, some patients developed meatal/urethral stenosis, which usually required additional procedures for resolution (bladder neck incision/urethrotomy).

#### 1.4. Retreatment

See Summary of findings 4, Table 2 (league table with the effect estimates) and Figure 5 (forest plot and SUCRA).

Based on 10 studies with 799 participants (Abt 2018; Bdesha 1994; Brehmer 1999; Carnevale 2016; D'Ancona 1998; Dahlstrand 1995; Floratos 2001; Gao 2014; Gratzke 2017; Wagrell 2002), we are uncertain about the effects of PAE and PUL on retreatment compared to TURP at long-term follow-up (12 to 60 months; PUL: RR 2.39, 95% CI 0.51 to 11.1; PAE: RR 4.39, 95% CI 1.25 to 15.44). TUMT may result in a higher increase in retreatment rates (RR 9.71, 95% CI 2.35 to 40.13). TURP had the highest likelihood of being the most efficacious for this outcome; however, among minimally invasive procedures, PUL was the highest-ranked intervention (See SUCRA plot in Figure 5). The certainty of the evidence is very low for PUL and PAE due to major concerns about the within-study bias, imprecision, inconsistency (heterogeneity, see Table 3) and incoherence. The certainty of the evidence for TUMT is low due to major concerns about within-study bias and incoherence.

These results do not include CRFWVT or TIND because of short-term follow-up (these results are displayed separately below, under pairwise comparisons).

#### 1.5. Erectile function

See Summary of findings 5, Table 2 (league table with the effect estimates) and Figure 6 (forest plot and SUCRA).

Based on six studies with 640 participants (Abt 2018; Carnevale 2016; Chughtai 2020; Gratzke 2017; McVary 2016; Roehrborn

2013), we are very uncertain of the effects of minimally invasive treatments on erectile function (MD of IIEF-5, range 5 to 25, higher scores indicates better function; CRFWVT: 6.49, 95% CI -8.13 to 21.12; TIND: 5.19, 95% CI -9.36 to 19.74; PUL: 3.00, 95% CI -5.45 to 11.44; PAE: -0.03, 95% CI -6.38, 6.32). CRFWVT and TIND have the highest likelihood of being the most efficacious for this outcome, while TURP was the lowest-ranked intervention (See SUCRA plot in Figure 6); the certainty of the evidence is very low due to major concerns about the within-study bias, incoherence and severe imprecision.

Studies related to TUMT did not report this outcome as defined in this analysis (these results are displayed separately below in pairwise comparisons).

#### 1.6. Ejaculatory function

See Summary of findings 6, Table 2 (league table with the effect estimates) and Figure 7 (forest plot and SUCRA).

Based on eight studies with 461 participants (Abt 2018; Ahmed 1997; Carnevale 2016; Dahlstrand 1995; Floratos 2001; Gratzke 2017; Insausti 2020; Norby 2002), we are uncertain of the effects of PUL, PAE, and TUMT on ejaculatory dysfunction compared to TURP (at 3 to 12 months; PUL: RR 0.05, 95 % CI 0.00 to 1.06; PAE: RR 0.35, 95% CI 0.13 to 0.92; TUMT: RR 0.34, 95% CI 0.17 to 0.68). PUL has the highest likelihood of being the most efficacious for this outcome, while TURP was the lowest-ranked intervention (See SUCRA plot in Figure 7). The certainty of the evidence is very low due to major concerns about the within-study bias, inconsistency (heterogeneity, see Table 3), and incoherence.

CRFWVT was not included in this section because these studies were disconnected from the network (see description below). The study assessing TIND reported no events of ejaculatory dysfunction.

#### 1.7. Minor adverse events

Based on 13 studies with 1374 participants (Abbou 1995; Blute 1996; Carnevale 2016; Chughtai 2020; D'Ancona 1998; Dahlstrand 1995; Gao 2014; Larson 1998; McVary 2016; Norby 2002; Pisco 2020; Radwan 2020; Wagrell 2002), TUMT, PAE, CRFWVT, and TIND may result in a greater incidence of minor adverse events compared to TURP, but the confidence interval includes substantial benefits and harms (TUMT: RR 1.43, 95% CI 0.74 to 2.75; CRFWVT: RR 1.78, 95% CI 0.51 to 6.21; TIND: RR 3.35, 95% CI 0.74 to 15.26; PAE: RR 1.06, 95% CI 0.57 to 1.99). TURP had the highest likelihood of being the most efficacious for this outcome; however, among minimally invasive procedures PAE was the highest-ranked intervention (see data in Table 2). The certainty of the evidence is low due to major concerns about within-study bias and severe imprecision.

The most commonly reported minor adverse events included: urinary tract infection, hematuria, dysuria, hematospermia, and pain. For PAE, a "post-embolization syndrome" was described, consisting primarily of pain, malaise, and frequent urination.

PUL was not included in this analysis since the contributing studies reported minor adverse events in greater detail and incidence, which contributed to significant incoherence in the network (these results are displayed separately below in pairwise comparisons).

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

### 1.8. Acute urinary retention

Based on 19 studies with 2235 participants (Abt 2018; Ahmed 1997; Albala 2002; Blute 1996; Chughtai 2020; Dahlstrand 1995; De Wildt 1996; Gao 2014; Gratzke 2017; Insausti 2020; Larson 1998; McVary 2016; Nawrocki 1997; Norby 2002; Radwan 2020; Roehrborn 1998; Roehrborn 2013; Wagrell 2002; Zhu 2018), CRFWFT, TIND, and PAE may result in a greater incidence of acute urinary retention compared to TURP, but the confidence interval includes substantial benefits and harms (CRFWVT: RR 2.02, 95% CI 0.07 to 55.79; TIND: RR 2.73, 95% CI 0.1 73.42; PAE: RR 1.82, 95% CI 0.75 to 4.41). PUL may result in little to no difference in the incidence of acute urinary retention compared to TURP, but the confidence interval includes substantial benefits and harms (RR 1.09, 95% CI 0.12 to 10.03). The certainty of the evidence for these estimates is low due to major concerns about within-study bias and imprecision. TUMT may result in a greater incidence of acute urinary retention compared to TURP (RR 2.93, 95% CI 1.19 to 7.22). The certainty of the evidence is low due to major concerns on within-study bias and inconsistency (heterogeneity, see Table 3). Furthermore, TURP and PUL had the highest likelihood of being the most efficacious for this outcome (see data in Table 2).

#### 1.9. Indwelling urinary catheter

Most of the included studies did not adequately report this outcome since they usually only mention catheterization as an event related to acute urinary retention. Therefore, there was insufficient information to perform a network meta-analysis.

#### 2. Pairwise comparisons

The supporting data from the pairwise comparisons are available in the analyses Analysis 1.1; Analysis 1.2; Analysis 1.3; Analysis 1.4; Analysis 1.5; Analysis 1.6; Analysis 1.7; Analysis 1.8; Analysis 1.9; Analysis 1.10; Analysis 1.11; Analysis 1.12; Analysis 1.13; Analysis 1.14; Analysis 1.15; Analysis 1.16; Analysis 1.17; Analysis 1.18; Analysis 1.19; Analysis 2.1; Analysis 2.2; Analysis 2.3; Analysis 2.4; Analysis 2.5; Analysis 2.6; Analysis 2.7; Analysis 2.8; Analysis 2.9; Analysis 2.10; Analysis 2.11; Analysis 2.12; Analysis 2.13; Analysis 2.14. The full descriptions of these results are available in our supporting reviews (Franco 2021; Jung 2017; Jung 2019; Kang 2020). We describe here some key information that we were unable to include in our network meta-analysis, to preserve the transitivity of each network.

#### 2.1. Retreatment: CRFWVT and TIND

Based on one study with 197 participants (McVary 2016), we are very uncertain about the effects of CRFWVT on retreatment compared to sham treatment at three months follow-up (RR 1.36, 95% CI 0.06 to 32.86; Analysis 2.4). Based on another study with 185 participants (Chughtai 2020), we are very uncertain about the effects of TIND on retreatment compared to sham treatment at three-month follow-up (RR 0.67, 95% CI 0.11 to 3.89; Analysis 2.4). The certainty of the evidence is very low due to concerns about the risk of bias and severe imprecision. These results could not be included in the network due to their short-term follow-up.

#### 2.2. Erectile function: TUMT

Based on four studies with 278 participants (Ahmed 1997; Floratos 2001; Norby 2002; Wagrell 2002), TUMT may result in little to no difference in erectile function (defined as an event of erectile dysfunction) compared to TURP at short-term follow-up (RR 0.79,

95% CI 0.40 to 1.55;  $I^2 = 0\%$ , Analysis 1.10). One study (Wagrell 2002) found a similar result at long-term follow-up (RR 0.49, 95% CI 0.17 to 1.41, Analysis 1.11). The certainty of the evidence is low due to concerns about the risk of bias and imprecision. These results could not be included in the network because they were assessed as binary data and not IIEF scores.

#### 2.3. Ejaculatory function: CRFWVT

Based on one study with 131 participants (McVary 2016), CRFWVT may result in little to no difference in events of ejaculatory dysfunction compared to sham treatment at short-term followup (RR 4.01, 95% CI 0.22 to 72.78, Analysis 2.9). The certainty of the evidence is low due to concerns about the risk of bias and imprecision. These results could not be included in the network because they were disconnected from all nodes.

#### 2.4. Minor adverse events: PUL

Based on one study with 79 participants (Gratzke 2017), PUL may result in little to no difference on minor adverse events compared to TURP (RR 0.88, 95% CI 0.70 to 1.09; Analysis 1.15). The certainty of the evidence is low due to concerns about the risk of bias and imprecision. These results could not be included in the network because they introduced incoherence, probably related to a different pattern in the report of adverse events (they reported a higher incidence, and reported in greater detail).

#### 3. Subgroup analysis

We investigated the sources of heterogeneity for urologic symptoms scores and quality of life. We did not identify heterogeneity for major adverse events. Some of the subgroup analyses were not possible to perform due to the scarcity of data (see Differences between protocol and review).

#### 3.1. Urologic symptoms scores

We were unable to identify subgroup differences due to age or symptom severity for the comparisons to TURP (Test for subgroup differences: Chi<sup>2</sup> = 0.01, degrees of freedom [df] = 1 [P = 0.93], l<sup>2</sup> = 0%, see Analysis 1.18; Test for subgroup differences: Chi<sup>2</sup> = 0.31, df = 1 [P = 0.58], l<sup>2</sup> = 0%, see Analysis 1.19) or due to age for the comparisons to sham treatment (test for subgroup differences: Chi<sup>2</sup> = 0.99, df = 1 [P = 0.32], l<sup>2</sup> = 0%, see Analysis 2.13).

#### 3.2. Quality of life

We were unable to find subgroup differences due to age for the comparisons to sham treatment (Analysis 2.14).

#### DISCUSSION

#### Summary of main results

We included 27 trials with 3017 randomized participants, assessing the effects of minimally invasive treatments, compared to TURP or sham treatment. The main findings of our network meta-analysis are the following.

**Urologic symptoms scores:** At short-term follow-up, PUL and PAE may result in little to no difference in urologic symptoms scores compared to TURP at short-term follow-up. CRFWVT, TUMT, and TIND may result in worse urologic symptoms scores compared to TURP, but the confidence intervals include little to no difference.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

**Quality of life:** At short-term follow-up, all interventions may result in little to no difference in the quality of life, compared to TURP.

**Major adverse events:** TUMT probably results in a large reduction in major adverse events compared to TURP, whereas the other treatment modalities (PUL, CRFWVT, TIND, and PAE) may result in a large reduction in major adverse events.

**Retreatment:** We are very uncertain of the effects of PUL and PAE on retreatment when compared to TURP. TUMT may result in a substantial increase in retreatment rates.

**Erectile function:** We are very uncertain of the effects of CRFWVT, TIND, PUL, and PAE on erectile function.

**Ejaculatory function:** We are very uncertain of the effects of PUL, PAE, and TUMT on ejaculatory dysfunction compared to TURP.

**Minor adverse events:** TUMT, PAE, CRFWVT, and TIND may result in a greater incidence of minor adverse events compared to TURP. PAE had a higher probability of being the best intervention, compared to others.

Acute urinary retention: TUMT, CRFWFT, TIND, and PAE may result in a greater incidence of acute urinary retention compared to TURP, and PUL may result in little to no difference in this outcome.

**Indwelling urinary catheter:** There was insufficient information to perform a network meta-analysis for this outcome.

TURP is the reference treatment with the highest likelihood of being the most efficacious for urinary symptoms, quality of life, retreatment, minor adverse events, and acute urinary retention, but the least favorable in terms of major adverse events, erectile function, and ejaculatory function. Among minimally invasive procedures, PUL and PAE have the highest likelihood of being the most efficacious for urinary symptoms and quality of life; TUMT for major adverse events; PUL for retreatment, ejaculatory function, and acute urinary retention; CRFWVT and TIND for erectile function; and PAE for minor adverse events.

# **Overall completeness and applicability of evidence**

The largest limitation of this study relates to issues related to the underlying body of evidence (see below), in particular, the lack of head-to-head trials for MITs against TURP. For example, RCTs for CRFWVT (McVary 2016) and TIND (Chughtai 2020) were limited to comparisons against sham treatment that were unblinded after three months and in many cases had short-term follow-up. The latter issues are underscored by the fact that the AUA guideline panel on the surgical management of LUTS had determined it required a minimum follow-up of greater than 12 months to supports its recommendations (Foster 2019, Parsons 2020), as reflected in the underlying systematic review (Dahm 2021a). Since longer-term RCT data is so limited, observational data may provide complementary information. For example, a systematic review of such studies found that the rate of retreatment may be higher for PUL than assessed here, close to 6% per year (Miller 2020a). Meanwhile, another systematic review has suggested that the longterm effects of CRFWVT may be sustained with a relatively low retreatment rate (Miller 2020b).

The reporting of adverse events was not uniform across studies, especially those that might be different across procedures, such as

the 'post-embolization syndrome' in PAE. This was also highlighted in a recent review of observational data in which over a quarter of patients suffered this syndrome, but it was not uniformly characterized (Svarc 2020). Whereas the Clavien-Dindo (Dindo 2004) system provides a well-established system to grade the severity of surgical complications, it may be less than ideal to characterize, for example, the adverse event profile for such different MITs as PUL and PAE.

A recent systematic review on men's values and preferences highlighted that they expect a high success rate with low remission and complication rates, which minimally invasive treatments may provide compared to TURP (Malde 2021). However, men also value the preservation of their sexual function, for which we have greater uncertainties. It is therefore important that clinicians engage in shared-decision making with their patients when discussing the available options (Dahm 2021b).

## **Quality of the evidence**

The certainty of the evidence was mostly low to very low due to the following considerations:

- Within-study bias: All of the included studies were rated as having a high or unclear risk of bias across outcomes. While in the comparisons to TURP it was mostly due to the lack of blinding of participants and personnel, there were also significant problems related to missing outcome data and an inadequate report of randomisation and allocation methods.
- Imprecision: Most of our combined estimates in the network meta-analysis and many in our pairwise analysis had substantial imprecision, including substantial benefits and harms. This was primarily due to a low number of participants in each comparison and, for dichotomous outcomes, few events.
- Inconsistency (heterogeneity): we found substantial unexplained heterogeneity in our estimates, although it was not a major concern in most cases.
- Incoherence: We drew our networks and compiled our data with careful consideration of transitivity by inspecting the distribution of effect modifiers to reduce the probability of finding global and local incoherence (see below). Nevertheless, some of our networks were loosely connected. Due to the lack of closed loops, we were unable to assess incoherence adequately. Therefore, following the current guidance, we rated down the certainty of the evidence.

There is also the possibility of novelty bias, which refers to the mere appearance that a new treatment is better when it is new (Salanti 2010; Salanti 2014). This type of bias can be assessed by the visual inspection of funnel plots (see Figure 3) where newer treatments such as PAE produce asymmetries with relation to older treatments in the distribution of effect sizes, related to the quality of life.

## Potential biases in the review process

We made minor modifications from our protocol regarding the reporting of additional data available in each supporting review (especially pairwise comparisons), and the display of the ranking results both graphically and in the 'Summary of findings' tables. These changes were documented in Differences between protocol and review.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Due to the adjustment in the outcome data that was required for our network meta-analysis (see above), there are minor differences with the estimates presented in the supporting reviews (Franco 2021; Jung 2017; Jung 2019; Kang 2020), with no substantial changes in direction and magnitude of effects.

The most important specification that we made throughout the conduct of our review was to restrict our network meta-analysis to the comparison of minimally invasive treatments versus TURP. This limited the presentation of multiple head-to-head comparisons between minimally invasive treatments. Therefore, we prioritized this main comparison, which would be most relevant to clinicians deciding between alternatives to TURP. Furthermore, considering the scarcity of data, we would have had an extremely low certainty of the evidence for these indirect estimates.

For our main analysis (Urologic symptoms scores - short-term), we found substantial incoherence based on the data of our supporting reviews. We then identified as a possible cause the different time points in which the outcomes were assessed (12, 24, and 52 weeks). Therefore, we extracted the data, when possible, for nearly all our results to the time point of 12 weeks, and incoherence was not subsequently identified. Additionally, we reclassified some of the events extracted as 'retreatment' within 'major adverse events', considering that our definition of retreatment was restricted to other interventions aimed at treating lower urinary tract symptoms and not including complications of the first procedure (which would be a major adverse event). Due to this, the pairwise comparisons do not exactly match those of our supporting reviews, although, in general, they present similar estimates. We had defined at the protocol stage the timing of each outcome as shortterm and long-term, but for adverse events, this was not clear from the report; therefore, we conducted a single analysis considering that most of these events (hematuria and clotting) were in the short term.

We were unable to include all available trials and interventions in all networks, primarily due to the lack of reporting of the outcomes in the desired format or definition. For the outcome 'retreatment', we were unable to include CRFWVT or TIND because of shortterm follow-up; for erectile function, ejaculatory function, CRFWVT was not included because the study was disconnected from the network, and the study related to TIND reported no events. For minor adverse events, PUL was not included in this analysis since the contributing studies reported minor adverse events in greater detail and incidence, which contributed to significant incoherence in the network. Moreover, long-term data was insufficient to build networks for some critical outcomes. Nevertheless, we included all available data in pairwise comparisons.

Finally, we were unable to perform subgroup and sensibility analysis due to the limited representation of subgroups in trials. Moreover, sensitivity analyses were not possible, considering that most of the studies were at a high or unclear risk of bias.

# Agreements and disagreements with other studies or reviews

We identified several systematic reviews focusing on minimally invasive treatments, reporting similar findings with regard to the efficacy of TIND, PUL, PAE, and CRFWVT, and highlighting that these are relatively effective treatments, with a lower incidence of adverse events and sexual dysfunction, compared to TURP (Amparore 2019; Jing 2020; Knight 2021; Tallman 2021; Tzeng 2021; Xiang 2021). While some of these findings are similar to our review, we highlight the uncertainty surrounding some of these outcomes, especially those related to sexual function, in which the data are sparse and usually available for only a subset of participants in each study, as was highlighted by one review (Lokeshwar 2020). Furthermore, many of these reviews included evidence from nonrandomized studies and had an overall low quality (Malling 2019; Tanneru 2020). In some cases, the evidence was synthesized by the authors of the primary studies (Amparore 2019; Zumstein 2019). There is a paucity of reviews focusing on TUMT in the last few years, considering that no trials are available since the previous version of the Cochrane Review (Hoffman 2012).

# AUTHORS' CONCLUSIONS

# **Implications for practice**

Minimally invasive treatments may result in similar or worse effects concerning urinary symptoms and quality of life, compared to the standard treatment (transurethral resection of the prostate) at short-term follow-up. They may result in a large reduction of major adverse events, especially in the use of prostatic urethral lift and prostatic arterial embolization, which resulted in better rankings for symptomatic symptoms scores. Prostatic urethral lift may result in fewer retreatments compared to other interventions, especially transure thral microwave thermotherapy, which has the highest retreatment rates at long-term follow-up. We are very uncertain about the effects of these interventions on erectile function; however, these treatments may result in fewer cases of ejaculatory dysfunction. Considering that patients value the effects of these treatments on urinary symptoms, retreatment rates, and adverse events, including sexual function, it becomes necessary to engage in shared decision-making when discussing their different treatment options, highlighting the existing uncertainties and eliciting their preferences.

# **Implications for research**

There needs to be a better reporting of basic trial methodology, such as methods of randomisation and allocation concealment, as well as a greater emphasis on patient-reported outcomes, especially those related to sexual function. These were usually described poorly in the included studies. Many studies broke the blinding period after three months, and patients crossed to the active treatment group, which prevented us from knowing the long-term effects of these interventions. This is particularly relevant for convective radiofrequency water vapor therapy and temporary implantable nitinol device, both of which are supported only by single trials that compared the new therapeutic approach to a sham control, with a three-month time horizon. Given the existence of a well-established and effective standard of care, and the availability of multiple other active treatment modalities, sham-controlled trials provide only limited and indirect evidence to inform decision-making (Dahm 2021a). Future research should be conducted in accordance with the 'Idea, Development, Exploration, Assessment, Long-term study' (IDEAL) principles, with the 'Assessment Stage' (corresponding to Phase III trials in drug development) centered around an active comparison of active treatment and a focus on patient-important outcomes (Tradewell 2019). Also, as reflected in a priori determinations by the American Urological Association guideline panel (Foster 2019; Parsons 2020), decision-making about surgical treatment options should be based

on follow-up data of greater than 12 months. A core outcome set, as it is available for a few other urological disease entities (Duffy 2021; Foust-Wright 2017; MacLennan 2017), should establish which outcomes should be collected, and how and when they should be collected.

# ACKNOWLEDGEMENTS

We are very grateful to Cochrane Urology, especially Assistant Managing Editor Jenn Mariano, as well as Cochrane Urology Korea, for supporting this review. We are also grateful for the constructive feedback from the Cancer Network and the Methods Support Unit.

We also thank the following individuals:

• Gretchen Kuntz for revising and providing feedback on the search strategies

- Marco Blanker, Sevann Helo, and Murad Mohammad for their peer review input of the protocol.
- Dominik Abt, Bilal Chughtai, and Ahmed Higazy for providing details on the outcomes of their trials, for them to be incorporated accurately in our review.
- Marc Sapoval, Deepak Agarwal, Cameron Alexander, Harris Foster, and Mitchell Humphreys for their peer review input of the review.

Juan Víctor Ariel Franco is a PhD candidate in the Programme of Methodology of Biomedical Research and Public Health, Universitat Autònoma de Barcelona (Spain).

This project is funded by the National Institute for Health Research (NIHR) [Cochrane Incentive Award (NIHR130819)]. The views expressed are those of the author(s) and not necessarily those of the NIHR or the Department of Health and Social Care.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

# Abbou 1995 (Continued)

Participants

Inclusion criteria: male participants:

- Age ≥ 50 years
- Voiding disorders for at least 3 months before inclusion
- No suspicion of prostatic cancer (assessed by digital rectal examination)
- Prostate weight between 30 and 80 g
- Peak Flow Rate (PFR) < 15mL/s for a voided volume ≥ 150 mL determined by two urine flow measurements</li>
- Residual urine volume < 300 mL
- Prostate-specific antigen (PSA) level <10ng/mL for a prostatic weight < 60 g or a PSA level < 15ng/mL for a prostatic weight ≥ 60 g
- Serum creatinine level < 160pmol/L
- No infection (assessed by bacteriological analysis of urine)
- Written informed consent

Exclusion criteria: male participants:

- Undergone previous surgery on the prostate or bladder
- Mental incapacity
- Any chronic disease potentially hindering follow-up
- Diabetes
- Participation in any clinical protocol within the last 3 months
- Any other urological disease
- Any medical treatment for voiding disorders within 15 days of inclusion
- Taken diuretics in the previous 3 months
- Anticoagulant therapy
- Allergy to lidocaine
- Colorectal disease.

Total number of participants randomized: 200

## Group 1: n = 66 Transurethral route hyperthermia

- Age, mean (SD): 65 (8) years
- Serum creatinine, mean (SD): 100 (19) mol/L
- Prostate weight, mean (SD): 45 (15) g
- PSA, mean (SD): 4.5 (2.7) ng/mL
- PFR, mean (SD): 10.4 (2.7)mL/s

## Group 2: n = 31 transurethral sham

- Age, mean (SD): 66 (7) years
- Serum creatinine, mean (SD): 92 (16) mol/L
- Prostate weight, mean (SD): 44 (11) g
- PSA, mean (SD): 4.2 (3) ng/mL
- PFR, mean (SD): 9.9 (2.5)mL/s

## Group 3: n = 65 Transrectal route hyperthermia

- Age, mean (SD): 66 (7) years
- Serum creatinine, mean (SD): 92 (19) mol/L
- Prostate weight, mean (SD): 45 (13) g
- PSA, mean (SD): 4.8 (2.8) ng/mL
- PFR, mean (SD): 9.8 (2.7)mL/s

## <u>Group 4: n = 38 transrectal sham</u>

Abbou 1995 (Continued)	<ul> <li>Age, mean (SD): 66 (7) years</li> <li>Serum creatinine, mean (SD): 90 (19) mol/L</li> <li>Prostate weight, mean (SD): 43 (15) g</li> <li>PSA, mean (SD): 5.0 (3.3) ng/mL</li> <li>PFR, mean (SD): 9.0 (3.3)mL/s</li> </ul>
Interventions	<u>Group 1 (n = 66) TUMT</u>
	Three devices were used for transurethral treatment (Thermex II, Technorex, Israel: Prostcare, Brucker Spectrospin, France; BSD-50. BSD Medical Corp, USA). Prostate temperature was monitored by an inte- grated microwave generator and controlled in each device through a fiber optic temperature monitor. All devices were used according to the manufacturer's instructions to deliver a temperature compatible with hyperthermia treatment (45 °C). Treatment was delivered in one session of 1 to 3 hs (depending on the device used).
	<u>Group 2 (n = 31) Sham TUMT:</u>
	Sham treatment consisted of a single session with the temperature maintained at 37 °C.
	<u>Group 3 (n = 65) Transrectal route hyperthermia:</u>
	Three devices were used for transrectal treatment (Prostathermer system, Biodan Medical Systems, Is- rael: Prostcare, Brucker Spectrospin, France: Primus, Tecnomatix Medical, Belgium). Prostate temper- ature was monitored by an integrated microwave generator and controlled in each device through a fiber-optic temperature monitor. All devices were used according to the manufacturer's instructions to deliver a temperature compatible with hyperthermia treatment (45 °C). Treatment was delivered in six sessions of 1 to 3hs (depending on the device used) for each session over 3 weeks.
	<u>Group 4 (n = 38) transrectal sham:</u> sham treatment consisted of a single session with the temperature maintained at 37 °C.
	<u>Co-interventions</u> : not reported
Outcomes	Urologic symptom scores
	<u>How measured</u> : Madsen score. Additionally, responders were participants showing excellent, good or moderate responses according to each of the criteria analyzed separately (Madsen score decrease >30%; a PFR >10 mL/s with a PFR increase > 30%).
	Time points measured: baseline, 3, 6, and 12 months
	Time points reported: baseline and 12 months
	Subgroups: none
	Retreatment
	<u>How measured</u> : number of participants with medical or surgical procedure (reported the numbers sep- arately for each)
	<u>Time points measured</u> : during treatment and 1 to 4 weeks after treatment (early post treatment com- plications)
	<u>Time points reported</u> : during treatment and 1 to 4 weeks after treatment (early post treatment compli- cations)
	Subgroups: none
	Major and minor adverse event/acute urinary retention
	<u>How measured</u> : number of patients with urethral bleeding, pain and urinary tract infection, acute uri- nary retention

Abbou 1995 (Continued)	
	<u>Time points measured</u> : during treatment and 1 to 4 weeks after treatment (early post treatment com- plications)
	<u>Time points reported</u> : during treatment and 1 to 4 weeks after treatment (early post treatment compli- cations)
	Subgroups: none
	Relevant outcomes not reported in this study
	Quality of life
	Erectile function
	Ejaculatory function
	Indwelling urinary catheter
Funding sources	This study was supported by a grant from the Comite d'Evaluation et de Diffusion des Innovations Technologiques (CEDIT), Assistance Publique-Hopitaux de Paris. Devices were lent by the following companies: Biodan, Brucker, BSD, Direx, and Tecnomatix.
Declarations of interest	Not available
Notes	We only included transurethral active and sham groups for the purpose of this review.
	No contact information available.
	Protocol: not available
	Language of publication: English

**Risk of bias** 

Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Low risk	Quote: "Randomization was stratified by the investigating centre and by approach (transrectal or transurethral), and was performed using permutation tables such that equal sample sizes were obtained for each type of approach, device and sham group."
		The investigators describe a random component in the sequence generation process.
Allocation concealment (selection bias)	Unclear risk	Quote: "Patients were randomly allocated to a treatment in a single treatment centre after verification of the inclusion criteria."
		Insufficient information to permit judgement of 'Low risk' or 'High risk'.
Blinding of participants and personnel (perfor-	Low risk	Quote: "Patients were not informed of their treatment, nor was the investiga- tor who enrolled the patients."
mance bias) Subjective outcomes		Blinding of participants and key study personnel ensured, and unlikely that the blinding could have been broken.
Blinding of outcome as- sessment (detection bias)	Low risk	Quote: "Patients were not informed of their treatment, nor was the investiga- tor who enrolled the patients."
Subjective outcomes		Blinding of participants and key study personnel ensured, and unlikely that the blinding could have been broken.
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Quote: "Patients were not informed of their treatment, nor was the investiga- tor who enrolled the patients."

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Abbou 1995 (Continued)

Trusted evidence. Informed decisions. Better health.

<b>bbou 1995</b> (Continued)		Blinding of participants and key study personnel ensured, and unlikely that the blinding could have been broken.
Incomplete outcome data (attrition bias)	High risk	There is an imbalance in numbers or reasons for missing data across interven- tion groups and potentially inappropriate application of simple imputation.
Urologic symptom scores/ Quality of life		Quote: "Patients lost to follow-up were classified according to maximum bias (in the sham groups as 'responders' and in the hyperthermia groups as 'non-responders')."
		Missing data only in group 2.
Incomplete outcome data (attrition bias)	High risk	There is an imbalance in numbers or reasons for missing data across interven- tion groups and potentially inappropriate application of simple imputation.
Major adverse events/mi- nor adverse events		Quote: "Patients lost to follow-up were classified according to maximum bias (in the sham groups as 'responders' and in the hyperthermia groups as 'non-responders')."
		Missing data only in group 2.
Incomplete outcome data (attrition bias)	High risk	There is an imbalance in numbers or reasons for missing data across interven- tion groups and potentially inappropriate application of simple imputation.
Retreatment		Quote: "Patients lost to follow-up were classified according to maximum bias (in the sham groups as 'responders' and in the hyperthermia groups as 'non- responders')."
		Missing data only in group 2.
Incomplete outcome data (attrition bias)	High risk	There is an imbalance in numbers or reasons for missing data across interven- tion groups and potentially inappropriate application of simple imputation.
Acute urinary retention		Quote: "Patients lost to follow-up were classified according to maximum bias (in the sham groups as 'responders' and in the hyperthermia groups as 'non- responders')."
		Missing data only in group 2.
Incomplete outcome data (attrition bias)	High risk	There is an imbalance in numbers or reasons for missing data across interven- tion groups and potentially inappropriate application of simple imputation.
Indwelling catheter		Quote: "Patients lost to follow-up were classified according to maximum bias (in the sham groups as 'responders' and in the hyperthermia groups as 'non- responders')."
		Missing data only in group 2.
Selective reporting (re- porting bias)	Unclear risk	No protocol available. Insufficient information to permit judgement of 'Low risk' or 'High risk'.
Other bias	Low risk	The study appears to be free of other sources of bias.

	<u>Setting</u> : single centre, national, outpatient/inpatient			
	<u>Country</u> : Sweden			
Participants	Inclusion criteria: men aged at least 40 years, TURP indicated, refractory to medical treatment or not willing to undergo or continue medical treatment, with a prostate size 25-80 mL as measured by trans- abdominal ultrasound, with an IPSS of at least 8, with an IPSS related QoL of at least 3 points, with a maximum urinary flow rate of less than 12 mL/s or urinary retention, and who provided written in- formed consent.			
	<u>Exclusion criteria</u> : men with severe atherosclerosis, aneurysmatic changes or severe tortuosity in the aortic bifurcation or internal iliac arteries, a contractile detrusor, neurogenic lower urinary tract dys-function, urethral stenosis, bladder diverticulum, bladder stone, allergy to intravenous contrast media, contraindication for magnetic resonance imaging, pre-interventionally proven carcinoma of the prostate, and renal failure (glomerular filtration rate < 60 mL/min).			
	Total number of participants randomly assigned: 103			
	<u>Group A</u> (PAE)			
	Number of all participants randomly assigned: 51			
	• Age (years): 65.7 ± 9.3			
	<ul> <li>Prostate volume (mL): 52.8 ± 32.0</li> <li>PSA (ng/mL): 4.2 ± 5.4</li> </ul>			
	<ul> <li>IPSK (lig/life): 4.2 ± 5.4</li> <li>IPSS: 19.38 ± 6.37</li> </ul>			
	• $Q_{max}$ (mL/s): 7.47 ± 4.14			
	<u>Group B(</u> TURP)			
	<ul> <li>Number of all participants randomly assigned: 52</li> <li>Age (years): 66.1 ± 9.8</li> </ul>			
	• Prostate volume (mL): 56.5 ± 31.1			
	• PSA (ng/mL): 4.5 ± 5.6			
	• IPSS: $17.59 \pm 6.17$			
	• Q <sub>max</sub> (mL/s): 7.25 ± 4.46			
Interventions	<u>Group A:</u> PAE			
	<u>Group B:</u> monopolar TURP			
	Follow-up: 12 weeks			
Outcomes	Urologic symptom scores			
	How measured: IPSS			
	Time points measured: at the baseline, 1, 6, and 12 weeks, 6, 12, and 24 months.			
	Time points reported: at the baseline, 1, 6, and 12 weeks, 12 and 24 months.

Interventions <u>Group 1 (n = 30)</u>: TUMT

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

59

Ahmed 1997 (Continued)					
	Done by a single operator using the Prostatron treatment catheter using the Prostasoft software (Tech- noMed, Lyon, France) in a single 60-min session under topical anesthesia with Instillagel(r) (FarcoPhar- ma GmBH, Cologne, Germany).				
	<u>Group 2 (n = 30)</u> : TURP				
	Performed on the routine operating lists by a surgeon of Senior Registrar grade or above using a stan- dard technique. No post-operative irrigation was used and all the resected tissue was submitted for his- tological examination. The urethral catheter was removed 3 or 4 days after surgery.				
	<u>Co-interventions</u> : "Intramuscular gentamicin (80 mg) was given before the treatment and oral trimethoprim (200 mg twice daily) was continued for 5 days. The patients were followed up at 6 weeks, 3 and 6 months, with a detailed evaluation performed at the last assessment."				
Outcomes	Urologic symptom scores				
	How measured: AUA symptom score				
	Time points measured: baseline, 6 weeks, 3 and 6 months				
	Time points reported: not reported (probably 6 months)				
	Subgroups: none				
	Indwelling urinary catheter/acute urinary retention				
	<u>How measured</u> : number of patients requiring an indwelling catheter after treatment due to acute uri- nary retention				
	Time points measured: 6 weeks, 3 and 6 months				
	Time points reported: not reported				
	Subgroups: none				
	Major adverse event				
	How measured: number of patients requiring blood transfusions after treatment.				
	Time points measured: not reported				
	Time points reported: not reported				
	Subgroups: none				
	Minor adverse event / Erectile function / Ejaculatory function				
	<u>How measured</u> : number of patients developing urinary tract infections or meatal narrowing that re- quired dilatation. Furthermore, adverse events related to erectile function and ejaculation are de- scribed under adverse events.				
	Time points measured: not reported				
	Time points reported: not reported				
	Subgroups: none

Incomplete outcome data (attrition bias) Indwelling catheter	Unclear risk	Not measured (not fully applicable - see narrative description of this outcome).
Selective reporting (re- porting bias)	High risk	Protocol not available - outcome data (urologic symptom score) was not avail- able for Group 2 at time points beyond three months. Quality of life data was not available for Group 2. We wrote to study authors.
Other bias	Low risk	No other sources of bias were identified.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

## Bdesha 1994

Study characteristics				
Methods	Study design: prospective, randomized parallel study.			
	<u>Study dates</u> : study dates not available			
	Setting: outpatient, single center, national			
	Country: United Kingdom			
Participants	Inclusion criteria: men with:			
	Symptoms of prostatism for at least 6 months			
	<ul> <li>World Health Organization's symptom score &gt; 14</li> </ul>			
	Residual urine volume of at least 50 mL			
	Peak flow rate less than 15 mL/s			
	Exclusion criteria: men with:			
	Malignant glands			
	Impaired renal function			
	History of prostatic surgery			
	<ul> <li>Residual urine volumes &gt; 200 mL</li> </ul>			
	<ul> <li>Large glands (length from bladder neck to proximal veru &gt; 40mm)</li> </ul>			
	Large obstructing middle lobes			
	Acute urinary retention			
	Coexisting urinary tract disease			
	Total number of participantsrandomized: 40			
	Group 1: n = 22 microwave treatment			
	• World Health Organization's symptom score, mean (95% CI): 30 (25.2-34.8)			
	<ul> <li>AUA symptom score, mean (95% CI): 19.2 (16.3-22.1)</li> </ul>			
	<ul> <li>Age, mean: 63.7 years (no 95% CI or SD available)</li> </ul>			
	<ul> <li>Q<sub>max</sub>, mean (95% Cl): 12.3 mL/s (10.7-13.9)</li> </ul>			
	• Residual vol, mean (95% Cl): 104 mL (85-125)			
	Group 2: n = 18 sham treatment			
	• World Health Organization's symptom score, mean (95% CI): 31 (25.5-36.5)			
	<ul> <li>AUA symptom score, mean (95% CI): 18.8 (16.0-21.7)</li> </ul>			
	<ul> <li>Age, mean: 62.6 years (no 95% CI or SD available)</li> </ul>			
	<ul> <li>Q<sub>max</sub>, mean (95% Cl): 10.8 mL/s (9.2-12.4)</li> </ul>			
	• Residual vol, mean (95% CI): 80 mL (57-103)			
Interventions	<u>Group 1 (n = 22):</u> TUMT			
	LEO Microthermer was used in all participants in a single active 90-minute treatment using a LEO Mi- crothermer. This machine delivers a maximum power output of 20 watts at 915 MHz and incorporates an automatic power cutoff, which operates if the rectal temperature increases to greater than 42.5C.			
	<u>Group 2 (n = 18) sham</u> : Same procedure, however participants received 90-min sham treatment with n power delivered. Participants received a heating pad to simulate hyperthermia.			
	<u>Co-interventions</u> : topical lidocaine gel was used alongside flexible cystoscopy to exclude a coexisting lower urinary tract pathological condition and to measure the prostate.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Bdesha 1994 (Continued)

Allocation concealment (selection bias)	Unclear risk	The study describes only "sealed envelope." Insufficient information to permit judgement of 'Low risk' or 'High risk'.
Blinding of participants and personnel (perfor- mance bias) Subjective outcomes	Low risk	Quote: "The patients were also asked which treatment they thought they had received: 19 of those who had received microwave treatment answered cor- rectly, while half the patients who had received sham treatment thought they had received a real treatment."
		Judgement: Participants and personnel administrating the questionnaires were blinded.
Blinding of outcome as- sessment (detection bias) Subjective outcomes	Low risk	Double-blind study. Participants and study personnel were blinded (see above).
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Double-blind study. Participants and study personnel were blinded (see above).
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	Low risk	Only two participants (10%) in the sham group were lost at follow-up.
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	Low risk	Only two participants (10%) in the sham group were lost at follow-up.
Incomplete outcome data (attrition bias) Retreatment	Low risk	Only two participants (10%) in the sham group were lost at follow-up.
Incomplete outcome data (attrition bias) Erectile function	Low risk	Only two participants (10%) in the sham group were lost at follow-up.
Incomplete outcome data (attrition bias) Ejaculatory function	Low risk	Only two participants (10%) in the sham group were lost at follow-up.
Incomplete outcome data (attrition bias) Acute urinary retention	Low risk	Only two participants (10%) in the sham group were lost at follow-up.
Incomplete outcome data (attrition bias) Indwelling catheter	Unclear risk	Only two participants (10%) in the sham group were lost at follow-up. Not fully measured (narrative statement).
Selective reporting (re- porting bias)	Unclear risk	No protocol available. Insufficient information to permit judgement of 'Low risk' or 'High risk'.
Other bias	Low risk	No other sources of bias were identified.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

## Blute 1996

Study characteristics				
Methods	<u>Study design</u> : parallel group randomized trial			
	Study dates: study dates not available			
	Setting: outpatient			
	<u>Country</u> : USA			
Participants	Inclusion criteria: men suffering from urinary symptoms (Madsen Symptom score > 8), PVR between 100 and 200 mL, PFR < 10 mL/s, prostate length between 35 and 50 mm on ultrasound examination.			
	<u>Exclusion criteria</u> : men receiving medication for said symptoms, metallic implants, conditions suggest ing neuropathic bladder, evidence of prostate cancer previous surgery (rectal or transurethral), antian drogen therapy, serum creatinine > 2 mg/dL, urinary retention, bladder stones, uncontrolled dysrhyth mias or cardiac pacemakers, and asymmetric median lobe enlargement.			
	Total number of participants randomized: 115			
	<u>Group 1 (n = 78) TUMT</u>			
	• AUA score, mean (SD): 19.9 (7.2)			
	• Age, mean (SD): 66.9 (7.8) years			
	<ul> <li>Prostate volume, mean (SD): 37.4 (14.2) mL</li> <li>mage (SD): 1.2 (1.6) mL /s</li> </ul>			
	• Q <sub>max</sub> , mean (SD): 1.3 (1.6) mL/s			
	$\underline{\text{Group 2 (n = 37) sham}}$			
	• AUA score, mean (SD): 20.8 (6.7)			
	<ul> <li>Age, mean (SD): 66.9 (7.1) years</li> <li>Prostate volume, mean (SD): 36.1 (13.4) mL</li> </ul>			
	<ul> <li>Q<sub>max</sub>, mean (SD): 7.4 (1.7) mL/s</li> </ul>			
Interventions	<u>Group 1 (n = 78)</u> : TUMT			
	Prostatron device is inserted by a 20F transurethral applicator (with 2 cooling channels) catheter and a rectal probe confirmed by ultrasonography. The specially designed transurethral catheter is comprise of a microwave antenna that allows. The treatment catheter emits a radiofrequency of 1,296 MHz. The treatment consists of three stages: 1) cooling (to 27 °C), 2) microwave emission to a threshold of 42.5 ° rectal temperature, 3) progressive cooling.			
	(Details provided in the report of a previous non-randomized study Blute 1996)			
	<u>Group 2 (n = 37)</u> : Sham			
	This consisted of circulation of urethral coolant without application of microwave power while a sham treatment was displayed on the computer monitor and the program run for 60 minutes.			
	<u>Co-interventions</u> : Patients were given anti-inflammatory agents and prophylactic antibiotics before and after (7 days) the procedure. If the patient experiences difficulties, a Foley catheter is inserted. See dation was used at discretion in (no sedation in 89% of TUMT sessions, and 100% of sham sessions).			
Outcomes	Urologic symptom scores			
	How measured: Madsen Symptom score / AUA symptom score			
	Time points measured: baseline, 6 weeks, 3, 6, and 12 months			
	<u>Time points reported</u> : baseline, 6 weeks, 3, 6, and 12 months (mostly graphically; comparative out- come data was only available at 3 months)			

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

lute 1996 (Continued)	Minor adverse events (including erectile/ejaculatory function)			
	How measured: narratively including sexual adverse events			
	Time points measured: at complete follow-up (12 months)			
	Time points reported: at complete follow-up (12 months)			
	Acute urinary retention			
	How measured: narratively			
	Time points measured: at complete follow-up (12 months)			
	Time points reported: at complete follow-up (12 months)			
	Relevant outcomes not reported in this study:			
	<ul> <li>Quality of life</li> <li>Retreatment</li> </ul>			
	Major adverse events			
	Indwelling urinary catheter			
Funding sources	Not available			
Declarations of interest	Not available			
Notes	Randomization ratio 2:1			
	Whereas the blinding lasted for 3 months, the follow-up time was 12 months.			
	The reporting of outcomes was not disaggregated by group (intervention vs. sham, but for the entire population) for most outcomes and time points.			
	Protocol: not available			
	Language of publication: English			

Bias	Authors' judgement	Support for judgement	
Random sequence genera- tion (selection bias)	Low risk	Quote: "The patients were randomized to TUMT or sham treatment in a 2:1 ra- tio based on a permuted-blocks procedure."	
Allocation concealment (selection bias)	Low risk	Quote: "Randomization assignments were distributed in sealed envelopes identified only by a unique patient number. The treating physician opened the envelope after completing all screening tests just prior to treatment."	
Blinding of participants and personnel (perfor- mance bias) Subjective outcomes	Low risk	Quote: "The evaluating physician was not the treating physician and was not allowed to enter the room. The study nurse who administered symptom score tests and supervised uroflowmetry was also blinded to the randomization scheme"	
		There was also "blinding verification" at 1 week after procedure: "When pa- tients were queried about the treatment they had received, only half of the TUMT patients (51.3%; 40 of 78) guessed correctly, and in the sham-treatment group, less than half of the patients (44.4%; 16 of 36) guessed correctly (Table 2)."	
Blinding of outcome as- sessment (detection bias)	Low risk	Double blind study - see above.	

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Blute 1996 (Continued) Subjective outcomes

Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Double blind study - see above.
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	High risk	"Of the 150 patients treated 118 had Madsen symptom score data at 12 months, since 11 discontinued the study or were lost to follow-up, 16 were re- treated with the Prostatron unit, 4 received alternative therapy (3 underwent transurethral procedures, and 1 received terazosin) and 1 was missing a Mad- sen score at follow-up."
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	Unclear risk	No information on missing data for other outcomes beyond urinary symp- toms.
Incomplete outcome data (attrition bias) Erectile function	Unclear risk	No information on missing data for other outcomes beyond urinary symp- toms.
Incomplete outcome data (attrition bias) Ejaculatory function	Unclear risk	No information on missing data for other outcomes beyond urinary symp- toms.
Incomplete outcome data (attrition bias) Acute urinary retention	Unclear risk	No information on missing data for other outcomes beyond urinary symp- toms.
Selective reporting (re- porting bias)	High risk	No protocol available. Data was presented graphically for most time points. Comparative outcome data was only available at 3 month-follow-up for some outcomes.
Other bias	Low risk	No other sources of bias were detected.

## Brehmer 1999

Study characteristics

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

	Language of publication: English		
	Protocol: not available		
	No contact information available.		
	Two patients withdrew during the 1-year study period, leaving 42 patients for the final evaluation.		
Notes	ICS questionnaire consists of 32 questions, most of which comprise an 'A' question about the actual symptom and a 'B' question about the bother related to the symptom. The questionnaire also includes several questions about sexual function (nos 24-27); these were all excluded from the instrument used in the present study. The maximum A and B scores are 124 and 92, respectively; a high score indicates worse symptoms.

Risk of bias		
Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Unclear risk	Judgement: not described.
Allocation concealment (selection bias)	Unclear risk	Judgement: not described.
Blinding of participants and personnel (perfor- mance bias) Subjective outcomes	High risk	Judgement: not described; blinding highly unlikely to have taken place.
Blinding of outcome as- sessment (detection bias) Subjective outcomes	High risk	Judgement: not described; blinding highly unlikely to have taken place.
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Judgement: objective outcomes are likely not affected by lack of blinding.
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	Low risk	Judgement: all randomized participants were included in the analysis (short term).
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	Low risk	Judgement: all randomized participants were included in the analysis (short term).
Incomplete outcome data (attrition bias) Retreatment	Low risk	Judgement: all randomized participants were included in the analysis (short term).
Incomplete outcome data (attrition bias) Erectile function	Low risk	Judgement: all randomized participants were included in the analysis (short term).

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

## Carnevale 2016 (Continued)

Incomplete outcome data (attrition bias) Ejaculatory function	Low risk	Judgement: all randomized participants were included in the analysis (short term).
Selective reporting (re- porting bias)	Unclear risk	Judgement: study outcomes were well pre-defined and described, but proto- col was not found.
Other bias	Low risk	Judgement: statistical differences in baseline IIEF and Q <sub>max</sub> , but those likely underestimates the effect size of PAE (more conservative).

# Chughtai 2020

Study characteristic	S
Methods	Study design: prospective, randomized parallel study.
	Study dates: July 2015 and October 2018
	Setting: outpatient, multicenter, international
	Country: United States and Canada
Participants	Inclusion criteria: men with:
	Men aged 50 and above with symptomatic BPH.
	<ul> <li>IPSS symptom severity score ≥ 10</li> </ul>
	<ul> <li>Peak urinary flow of &lt; 12 mL/sec. Meeting the criterion on two separate voiding trials, on a minimur voided volume of at least 125 cc for each voiding trial.</li> </ul>
	• Prostate volume between 25 mL to 75 mL (assessed by ultrasound)
	<ul> <li>Blood CBC and biochemistry up to two weeks before screening demonstrating: Normal values of th PT, PTT, and INR tests (anticoagulants should be stopped according to GCP)</li> </ul>
	Subject able to comply with the study protocol and signed informed consent
	Normal Urinalysis and urine culture
	Exclusion Criteria:
	<ul> <li>Cardiac arrhythmias, cardiac disease including congestive heart failure, uncontrolled diabetes melli tus, significant respiratory disease, or known immunosuppression;</li> </ul>
	<ul> <li>Neurogenic bladder and/or sphincter abnormalities due to Parkinson's disease, multiple sclerosis cerebral vascular accident, diabetes</li> </ul>
	• A post void residual (PVR) volume > 250 mL measured by ultrasound or acute urinary retention
	<ul> <li>Compromised renal function (i.e., serum creatinine level &gt; 1.8 mg/dl, or upper tract disease);</li> </ul>
	<ul> <li>Confirmed or suspected bladder cancer;</li> </ul>
	<ul> <li>Recent (within 3 months) cystolithiasis or hematuria;</li> </ul>
	<ul> <li>Urethral strictures, bladder neck contracture, urinary bladder stones or other potentially confoundin bladder pathology;</li> </ul>
	An active urinary tract infection.
	<ul> <li>Enrolled in another treatment trial for any disease within the past 30 days.</li> </ul>
	<ul> <li>Previous colorectal surgery (other than hemorrhoidectomy) or history of rectal disease if the therap may potentially cause injury to sites of previous rectal surgery, e.g., if a transrectal probe is used;</li> </ul>
	<ul> <li>Previous pelvic irradiation, cryosurgery or radical pelvic surgery;</li> </ul>
	<ul> <li>Previous prostate surgery, balloon dilatation, stent implantation, laser prostatectomy, hyperthermia or any other invasive treatment to the prostate</li> </ul>
	History of prostatitis within the past 5 years.
	Median lobe obstruction of the prostate.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Chughtai 2020 (Continued)

- Cancer that is not considered cured, except basal cell or squamous cell carcinoma of the skin (cured defined as no evidence of cancer within the past 5 years).
- Any serious medical condition likely to impede successful completion of the study
- Participating in any other investigational study for either drug or device which can influence collection of valid data under this study.
- Subjects who are actively taking medications that affects urination and BPH symptoms not completing the required washout period.
- Baseline  $PSA \ge 10 \text{ ng/mL}$ .
- Positive DRE.
- Baseline PSA between 2.5-10 ng/mL and free PSA < 25%, without a subsequent negative prostate biopsy.

Total number of participants randomized: 185

Group 1: n = 128 temporarily implanted nitinol device (iTIND)

- Age (years), mean (SD): 61.5 (6.5)
- BMI, mean (SD): 28.8 (5.7)
- Comprehensive Complication Index (CCI), mean (SD): 2.52 (1.6)
- Prostate Volume, mean (SD): 43.4 (15.5)
- IPSS, mean (SD): 22.1 (6.8)
- Q<sub>max</sub>, mean (SD): 8.7 (3.3)
- Postvoid Residual Volume (PVR) m, mean (SD): 61.6 (55.5)
- QoL, mean (SD): 4.6 (1.3)
- PSA, mean (SD): 2.2 (2.3)
- Internation Index of Erectile Function (IIEF), mean (SD): 38.3 (20.7)
- Sexual Health Inventory For Men (SHIM), mean (SD): 13.2 (7.3)

Group 2: n = 57 Sham control

- Age (years), mean (SD): 60.1 (6.3)
- BMI, mean (SD): 28.8 (5.5)
- Comprehensive Complication Index (CCI), mean (SD): 1.26 (0.7)
- Prostate Volume, mean (SD): 43.8 (13.3)
- IPSS, mean (SD): 22.8 (6.2)
- Q<sub>max</sub>, mean (SD): 8.5 (2.4)
- Postvoid Residual Volume (PVR) mL, mean (SD): 61.9 (54.2)
- QoL, mean (SD): 4.9 (1)
- PSA, mean (SD): 1.8 (1.8)
- Internation Index of Erectile Function (IIEF), mean (SD): 39.1 (19.6)
- Sexual Health Inventory For Men (SHIM), mean (SD): 14.2 (6.6)

Interventions Group 1 (n = 128): "the iTind device is comprised of three elongated, intertwined nitinol struts at the 12, 5, and 7 o'clock positions, an anti-migration anchoring leaflet at 6 o'clock, and a polyester retrieval suture for easy device removal. The device is implanted for 5-7 days, during which it expands and exerts radial force, creating deep ischemic incisions, and a remodeling on the prostate tissue at the bladder neck and anterior prostatic fossa. The iTind is deployed under direct visualization in an ambulatory procedure using a rigid cystoscopy. The device is removed through either a rigid cystoscope or an open ended 22F Foley catheter with topical anaesthesia. Both implantation and removal can be done under local, IV, or general anaesthesia at the discretion of the performing physician. Catheterisation is not required following either implantation or removal."

<u>Group 2 (n = 57)</u>: "The sham control was the insertion and removal of an 18F silicon Foley catheter in order to simulate both the implantation and retrieval procedures. Throughout the procedure, the surgeon gave verbal description as if deploying the iTind device, after which the catheter was removed. A similar protocol was followed for the removal. Although the iTind device is deployed through a rigid cystoscope, a Foley catheter was used to minimize the risk of procedure-related morbidity."

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Chughtai 2020 (Continued)	<u>Co-interventions</u> : Subjects in both the device and control groups were draped to prevent them from seeing the treating physician and the device.
Outcomes	Urologic symptom scores
	How measured: IPSS score change from baseline
	Time points measured: baseline, 1.5 and 3 months
	Time points reported: baseline, 1.5, 3 (blinded) and 12 months (unblinded)
	<u>Subgroups</u> : none
	Quality of life
	How measured: not reported
	Time points measured: baseline, 1.5 and 3 months
	Time points reported: baseline, 1.5, 3, and 12 months (unblinded)
	Subgroups: none
	Acute urinary retention
	How measured: number of patients developing acute urinary retention
	Time points measured: not reported
	Time points reported: not reported
	Subgroups: none
	Erectile function
	How measured: IIEF and SHIM score
	Time points measured: baseline, 1.5 and 3 months
	Time points reported: not reported.
	Subgroups: none
	Retreatment
	How measured: Number of participants that received additional treatment
	Time points measured: baseline and 1 year
	Time points reported: baseline and 1 year (global, not by group)
	Subgroups: none
	Minor and major adverse event (including ejaculatory/erectile dysfunction/urinary retention)
	How measured: National Cancer Institute Common Toxicity Criteria for Adverse Events, version 4.0
	Time points measured: not reported
	Time points reported: not reported
	Subgroups: none
	Relevant outcomes not reported in this study:
	Indwelling urinary catheter (none of the participants required a catheter)

**Risk of bias** 

Funding sources	Medi-Tate Ltd. sponsored this study.	
Declarations of interest	Bilal Chughtai, MD is a consultant for Medi-Tate Ltd, Olympus, Boston Scientific, and Medeon Bio.	
Notes	The study was unblinded at three months follow-up.	
	Contact info: Bilal Chughtai, E-mail: bic9008@med.cornell.edu	
	Protocol: trial registry (NCT02506465)	
	Language of publication: English	

RISK OI DIAS		
Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Low risk	Quote: "Subjects were randomized in 2:1 ratio to either iTind or control groups using permuted blocks stratified by center by using a central electronic data program."
		The investigators describe a random component in the sequence generation process.
Allocation concealment (selection bias)	Low risk	Quote: "Subjects were randomized in 2:1 ratio to either iTind or control groups using permuted blocks stratified by center by using a central electronic data program."
		Participants and investigators enrolling participants could not foresee assign- ment.
Blinding of participants and personnel (perfor- mance bias) Subjective outcomes	Low risk	Subjective outcomes
Blinding of outcome as-	Low risk	Participants were blinded.
sessment (detection bias) Subjective outcomes		Quote: "This prospective, randomized, controlled, single blinded study of the second-generation iTind procedure"
Blinding of outcome as- sessment (detection bias)	Low risk	Participants were blinded. These outcomes are unlikely to be affected by blinding.
Objective outcomes		Quote: "This prospective, randomized, controlled, single blinded study of the second-generation iTind procedure"
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	High risk	Quote: Outcome data provided by the authors at 3 months: 84/128 interven- tion group and 40/57 in the sham group.
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	High risk	The authors state that 13/118 (11%) and 10/57 (17%) were lost to follow-up at 3 months. Unbalanced attrition. This analysis was not imputed.
Incomplete outcome data (attrition bias) Retreatment	High risk	The authors state that 13/118 (11%) and 10/57 (17%) were lost to follow-up at 3 months. Unbalanced attrition. This analysis was not imputed.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

## Chughtai 2020 (Continued)

Incomplete outcome data (attrition bias) Erectile function	High risk	The authors state that 13/118 (11%) and 10/57 (17%) were lost to follow-up at 3 months. Unbalanced attrition. This analysis was not imputed.
Incomplete outcome data (attrition bias) Ejaculatory function	High risk	The authors state that 13/118 (11%) and 10/57 (17%) were lost to follow-up at 3 months. Unbalanced attrition. This analysis was not imputed.
Incomplete outcome data (attrition bias) Acute urinary retention	High risk	The authors state that 13/118 (11%) and 10/57 (17%) were lost to follow-up at 3 months. Unbalanced attrition. This analysis was not imputed.
Selective reporting (re- porting bias)	Unclear risk	The study registry only specified two outcomes at three months (IPSS and "secondary safety"). We wrote to the study author for more information.
Other bias	Low risk	No other sources of bias were detected.

# D'Ancona 1998

Study characteristics	s
Methods	Study design: parallel-group randomized trial
	Study dates: January 1994 to August 1995
	Setting: outpatient
	<u>Country</u> : Netherlands
Participants	Inclusion criteria: men
	• 45 years old or older
	Clinically unequivocal benign prostate
	<ul> <li>Prostatic length 25 to 50 mm – volume 30 to 100 cm3</li> </ul>
	<ul> <li>Symptoms &gt; 3 months</li> </ul>
	Madsen symptom score 8 or greater
	<ul> <li>PFR peak flow rate 15 mL per second</li> </ul>
	Minimum voided volume of 100 mL
	Post-void residual 350 mL or less
	<ul> <li>Willingness and ability to comply with the study follow-up</li> </ul>
	Exclusion criteria:
	Neurogenic disorders that may affect bladder function
	Prostatic carcinoma
	Prior surgery of the prostate,
	<ul> <li>Microwave sensitive implants (pacemaker or hip prothesis)</li> </ul>
	Diabetic neuropathy
	<ul> <li>Urinary retention requiring an indwelling catheter</li> </ul>
	Renal impairment
	<ul> <li>Obstructed bladder neck due to an enlarged median lobe of the prostate,</li> </ul>
	Those who were on medication prescribed for treatment of the prostate or bladder
	Sample size: 52 patients were randomized
	<u>Group 1: n = 125 transurethral microwave thermotherapy (TUMT)</u>

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

D'Ancona 1998 (Continued)

Trusted evidence. Informed decisions. Better health.

D'Ancona 1998 (Continued)	<ul> <li>Age, mean (SD): 69.6 ± 8.5</li> <li>Prostate volume (cc), mean (SD): 45 ± 15</li> <li>IPSS score, mean (SD): 16.7 ± 5.6</li> <li>Q<sub>max</sub> (mL/s), mean (SD): 9.3 ± 3.4</li> <li>Residual volume, mL (SD): 91 ± 105</li> <li><u>Group 1: n = 125 transurethral resection of the prostate (TURP)</u></li> <li>Age, mean (SD): 69.3 ± 5.9</li> <li>Prostate volume (cc), mean (SD): 43 ± 12</li> <li>IPSS score, mean (SD): 18.3 ± 6.3</li> <li>Q<sub>max</sub> (mL/s), mean (SD): 10.0 ± 6.1</li> </ul>
	Residual volume, mL (SD): 58 ± 78
Interventions	<u>Group 1 (n = 31)</u> : TUMT
	Delivered using Prostatron device with software version 2.5, for 60 minutes increasing thermal dose up to 70 watts. Urethral and rectal thermal sensors provided feedback to prevent harms. Preparation in- cluded 100 mg diclofenac suppository and 2 mg of midazolam intramuscularly. If necessary, further in- travenous sedation was administered. All participants left with an indwelling urinary catheter.
	<u>Group 2 (n = 21)</u> : TURP
	Performed by two experienced urologists with use of spinal anaesthesia. The surgical capsule was reached circumferentially from the bladder neck to the verumontanum using 24 Ch. Resectoscopes.
	<u>Co-interventions</u> : not described
Outcomes	Urologic symptom scores
	How measured: Madsen symptom score and IPSS
	Time points measured: 1, 3, 6, and 12 months
	Time points reported: 3, 6, 12 months
	Subgroups: none
	Major and minor adverse events
	How measured: episodes of urinary tract infection, haematuria
	Time points measured: not reported

	<ul> <li>Previous prostatic surgery or heat treatment</li> </ul>				
	<ul> <li>Alpha-adrenergic blockers (within 4 weeks), antiandrogen medication (within 1 year), or other medication that may affect the prostate or bladder</li> </ul>				
	Bacterial prostatitis or urinary tract infection at the time of treatment				
	<ul> <li>Prostatic urethral length of &lt; 35 or &gt; 50 mm (transrectal ultrasound)</li> </ul>				
	Anesthesia risk category 4 or 5 (ASA class 4 or 5)				
	Total number of participantsrandomized: 93				
	<u>Group 1 (n = 46) TUMT</u>				
	Mean age: 68 years				

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Dahlstrand 1995 (Continued)

Trusted evidence. Informed decisions. Better health.

	<ul> <li>Mean prostate volume: 33 mL</li> <li>Madsen symptom score, mean (SD): 11.2 (3.1)</li> <li>Peak urinary flow: 8.0 mL/s</li> <li>Postvoid residual: 105 mL</li> <li>Group 2 (n = 47) TURP</li> </ul>
	<ul> <li>Mean age: 70 years</li> <li>Mean prostate volume: 37 mL</li> <li>Madsen symptom score, mean (SD): 13.3 (4.2)</li> <li>Peak urinary flow: 7.9 mL/s</li> <li>Postvoid residual: 116 mL</li> </ul>
Interventions	<u>Group 1 (n = 39)</u> : TUMT One-hour treatment in a single session performed by a single physician using the Prostatron (Tech- nomed International, France) only with topical anaesthesia and oral analgesia. The urethral catheter delivered up to 60 W of microwave energy and monitored temperature (as well as the rectal probe) through a software. The urethral temperature could reach a maximum temperature of 44.5 °C and the rectal temperature could reach a maximum temperature of 42.5 °C. Postoperatively oral norfloxacin 400 mg twice a day, was administered for 5 days. An indwelling urethral catheter was placed and left in place for 3-5 days if the patient was unable to void after treatment.
	<u>Group 2 (n = 44)</u> : TURP Urologists who were at the level of senior registrar or above resected the prostate, using resectoscopes with a Charrière of 24-28, down to the surgical capsule circumferentially and extended from the blad- der neck to the verumontanum.
	<u>Co-interventions</u> : not reported.

Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Unclear risk	Quote: "patients were recruited for the study and blindly randomized."
		Insufficient information to permit judgement of 'Low risk' or 'High risk'. We wrote to study authors.
Allocation concealment	Unclear risk	Quote: "patients were recruited for the study and blindly randomized."
(selection bias)		Insufficient information to permit judgement of 'Low risk' or 'High risk'. We wrote to study authors.
Blinding of participants and personnel (perfor-	High risk	Whereas blinding was not mentioned, the interventions were visibly different (surgery versus outpatient procedure).
mance bias) Subjective outcomes		The subjective outcomes were likely to be influenced by lack of blinding.
Blinding of outcome as- sessment (detection bias)	High risk	Whereas blinding was not mentioned, the interventions were visibly different (surgery versus outpatient procedure).
Subjective outcomes		The subjective outcomes were likely to be influenced by lack of blinding.
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Whereas blinding was not mentioned, the interventions were visibly different (surgery versus outpatient procedure).
		The objective outcomes were unlikely to be influenced by lack of blinding.
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	Low risk	12-month follow-up, 78 participants (93%) had available data (first report)
		Quote: "Four patients were excluded; 1 patient because he contracted severe hepatitis while abroad precluding follow-up; 2 patients because cancer was discovered at the time of histological examination of the TUR specimen requir- ing orchiectomy, and 1 patient who refused randomisation to TURP."
		Judgement (12 months): low risk of bias (main judgement).
		2-year follow-up, 61 participants (73%) had available data (second report).

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Dahlstrand 1995 (Continued)		Quote: "All patients were followed for 2 years but in 10 patients the follow-up was incomplete. In the TURP group, one patient died from a brain tumour after his 6-month follow-up. At the 2-year follow-up, one patient underwent an operation for a lumbar disc hernia and was unavailable. In the TUMT group, one patient was abroad at the 3-month follow-up and after the 6-month follow-up, two patients had a TURP and were excluded from the study, one patient refused further follow-up and another suffered severe pancreatitis which precluded that visit. Two patients who had undergone a second TUMT after the 6-month follow-up took part in the 1-year follow-up but had not improved and, after undergoing TURP, they were excluded before the 2-year follow-up. One patient was disabled due to severe neurological disease after the 1-year follow-up."
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	Low risk	See above (main judgement).
Incomplete outcome data (attrition bias) Retreatment	High risk	See above (long-term judgement).
Incomplete outcome data (attrition bias) Erectile function	Low risk	See above (main judgement).
Incomplete outcome data (attrition bias) Ejaculatory function	Low risk	See above (main judgement).
Incomplete outcome data (attrition bias) Acute urinary retention	Low risk	See above (main judgement).
Incomplete outcome data (attrition bias) Indwelling catheter	Unclear risk	Not fully measured (narrative statement).
Selective reporting (re- porting bias)	Low risk	No protocol available. Insufficient information to permit judgement of 'Low risk' or 'High risk'. We wrote to study authors.
Other bias	Low risk	No other sources of bias were identified.

Study characterist	ics
Methods	Study design: parallel group randomized trial
	<u>Study dates</u> : Start date June 1991 – End date December 1992
	Setting: outpatient, multicenter, international
	Country: Netherlands and the United Kingdom

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

De Wildt 1996 (Cor	ntinued)
--------------------	----------

e Wildt 1996 (Continued	d)			
Participants	<u>Inclusion criteria</u> : men aged > 45 years complaining of symptoms of bladder outlet obstruction for > 3 months, with a Madsen symptom score of > 8 and urinary free-flow rate estimates of < 15 mL/s dur- ing two voids of >150 mL. Prostatic enlargement was confirmed by transrectal ultrasonography, PSA or prostatic biopsy if necessary.			
	<u>Exclusion criteria</u> : prostate cancer, prostatitis, urethral stricture, intravesical pathology (stones, neoplasm), neurogenic bladder dysfunction, urinary tract infection, isolated enlargement of the middle lobe, a residual urine volume of >300 mL, use of drugs influencing bladder or prostate function, previous transurethral resection of the prostate or transurethral incision, a metallic pelvic implant, disorders of blood flow or coagulation, diabetes mellitus and mental incapacity or inability to give informed consent.			
	<u>Total number of participants</u> randomized: 93 men recruited but 90 were randomized (there is no furthe detail on the report)			
	<u>Group 1: n = 46 TUMT</u>			
	<ul> <li>Mean age (SD): 66.3 (8.1) years</li> <li>Prostate volume (SD): 48.6 (16.6) mL</li> <li>Madsen score (SD): 13.7 (3.4) points</li> <li>Peak Flow (SD): 9.2 (2.5) mL/s</li> <li>PVR (SD): 93.9 (75.4) mL</li> <li>Voided fraction (SD): 74.9% (16.6)</li> </ul>			
	<u>Group 2: n = 47 Sham</u>			
	<ul> <li>Mean age (SD): 66.9 (6.0) years</li> <li>Prostate volume (SD): 49.0 (20.0) mL</li> <li>Madsen score (SD): 12.9 (3.1) points</li> <li>Peak Flow (SD): 9.6 (2.7) mL/s</li> <li>PVR (SD): 84.7 (66.1) mL</li> <li>Voided fraction (SD): 77.3% (15.7)</li> </ul>			
Interventions	<u>Group 1 (n = 46)</u> : TUMT			
	A single session of Prostatron treatment unit which consisted of a microwave generator, urethral ap- plicator/cooler, fiber optic temperature-monitor, and couch. This study used the lower energy ther- motherapy protocol (Prostasoft 2.0).			
	<u>Group 2 (n = 47)</u> : Sham			
	Same procedure as in TUMT with a simulated program.			
	<u>Co-interventions</u> : Not described			
Outcomes	Urologic symptoms score			
	How measured: Madsen symptom score			
	Time points measured: baseline, 6, 12, 26, 52 weeks			
	<u>Time points reported</u> : baseline, 6, 12, 26, 52 weeks			
	Subgroups: none			
	Quality of life			
	How measured: ad-hoc questionnaire (not validated)			
	Time points measured: baseline, 12 and 26 weeks			
	Time points reported: baseline, 12 and 26 weeks			

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

De Wildt 1996 (Continued)

Trusted evidence. Informed decisions. Better health.

	(this questionnaire includes questions of sexual function)
	Major and minor adverse event
	How measured: major and minor adverse events
	Time points measured: not reported
	Time points reported: at 3 months
	Indwelling urinary catheter/acute urinary retention
	<u>How measured</u> : number of participants that required a catheter after the procedure due to urinary re- tention
	Time points measured: not reported
	Time points reported: at 3 months
	Relevant outcomes not reported in this study
	<ul> <li>Erectile function (see "quality of life")</li> <li>Ejaculatory function (see "quality of life")</li> <li>Retreatment</li> </ul>
Funding sources	Not available
Declarations of interest	Not available
Notes	This study reports the trial by location and globally. The quality of life results are only available for the Netherlands report.
	After three months patients were offered TUMT. 27 participants in the Sham group and 4 participants in the TUMT group received a verum procedure, thus the results of this trial beyond three months are not included in this review.
	No contact information available.
	Protocol: not available
	Language of publication: English

Incomplete outcome data (attrition bias) Indwelling catheter	Unclear risk	Data was not available at three months for 3 participants in the Sham group (2 losses at follow-up and 1 technical failure) and 2 participants in the TUMT group (underwent TURP). Not fully measured (narrative statement).
Selective reporting (re- porting bias)	Unclear risk	Protocol not available. Insufficient information to permit judgement of 'Low risk' or 'High risk'.
Other bias	Low risk	No other sources of bias were identified.

### Floratos 2001

Study characteristics			
Methods	Study design: parallel group randomized trial		
	<u>Study dates</u> : start date January 1996 – end date March 1997		
	Setting: outpatient/inpatient, national, single-center		
	<u>Country</u> : The Netherlands		
Participants	<u>Inclusion criteria</u> : Male participants aged 45 years and older with a prostate volume ≥ 30 cm3, prosta- tic urethral length ≥ 25 mm, a Madsen symptom score ≥ 8, maximum peak flow rate ≤ 15 mL/s and a postvoid residual ≤ 350 mL.		
	<u>Exclusion criteria</u> : men with acute prostatitis or urinary tract infection, evidence of prostate carcinoma an isolated obstructed prostatic middle lobe, diabetes mellitus, intravesical pathology, neurological disorders, or current treatment with drugs that may influence the bladder function.		
	Total number of participants randomly assigned: 155		
	<u>Group 1 (n = 82) TUMT</u>		
	<ul> <li>Age (mean and range): 68 (54 to 77) years</li> <li>Prostate volume (mean and range): 42 (30 to 82) mL</li> </ul>		

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Floratos 2001 (Continued)	<ul> <li>PSA (mean ± SD): not reported</li> <li>IPSS (mean and range): 21 (10-28)</li> <li>Q<sub>max</sub> (mean and range): 9.0 (5.0-14.0) mL/second</li> <li><u>Group 2 (n = 73) TURP</u></li> </ul>
	<ul> <li>Age (mean and range): 66 (55-77) years</li> <li>Prostate volume (mean and range): 48 (31-84) mL</li> <li>PSA (mean ± SD): not reported</li> <li>IPSS (mean and range): 20 (11-29)</li> <li>Q<sub>max</sub> (mean and range): 8.4 ± 2.0mL/second</li> </ul>
Interventions	<u>Group 1 (n = 74)</u> : TUMT
	A one-hour session was administered by the Prostatron device (EDAP Technomed, Lyon, France) with a second-generation, high-energy protocol (Prostasoft 2.5) with a maximum power of 70 W and a rec- tal threshold set at 43.5 °C. Patients were administered 40 mg of morphine sulfate orally 2 hours before treatment. All participants received an indwelling Foley catheter following an outpatient voiding trial. Patients also received co-trimoxazole 960 mg twice a day for 5 days after treatment as prophylaxis.
	<u>Group 2 (n = 73)</u> : TURP
	It was performed under spinal anaesthesia and intended to remove as much prostate tissue as possible and all patients received an indwelling Foley catheter, which was removed when hematuria decreased sufficiently, and the participant completed a successful voiding trial.
	<u>Co-interventions</u> : not described
Outcomes	Urologic symptoms score
	How measured: IPSS score and Madsen score
	Time points measured: baseline, 3, 6, 12, 18, 24, and 36 months
	Time points reported: baseline, 12, 24, and 36 months
	Subgroups: none
	Quality of life
	How measured: 41-item questionnaire designed for BPH patients
	Time points measured: baseline, 1, 3, 6, and 12 months
	Time points reported: baseline, 12, and 52 weeks
	<u>Subgroups</u> : none
	Retreatment
	How measured: narratively
	Time points measured: baseline, 3, 6, 12, 18, 24, and 36 months
	<u>Time points reported</u> : 6, 12, 18, 24, 30, and 26 months
	Major and minor adverse events
	How measured: major and minor adverse events
	Time points measured: not reported
	Time points reported: at 3 months

Gratzke 201	7
-------------	---

Study characteristics	;
Methods	Study design: prospective, randomized, controlled, non-blinded study
	Dates when study was conducted: February 2012 to October 2013
	<u>Setting:</u> multicentre / international / outpatient/inpatient / 10 centres in Europe
	Countries: Denmark, the UK, Germany
Participants	Inclusion criteria: men aged ≥ 50 years with IPSS > 12, Q <sub>max</sub> ≤ 15 mL/second for 125 mL voided vol- ume, postvoid residual volume < 350 mL, prostate volume ≤ 60 mL on ultrasound, sexually active with- in 6 months before the index procedure, Sexual Health Inventory for Men score > 6, positive response to MSHQ-EjD (excluding the response "Could not ejaculate"), Incontinence Severity Index score ≤ 4
	<b>Exclusion criteria:</b> active urinary tract infection at time of treatment, bacterial prostatitis within 1 year of the index procedure, cystolithiasis within 3 months of the index procedure, obstructive median lobe as assessed via ultrasound and cystoscopy, current urinary retention, urethral conditions that may prevent insertion of a rigid 20 F cystoscope, previous TURP or laser procedure, pelvic surgery or irradiation, PSA ≥ 10 ng/L, history of prostate or bladder cancer, severe cardiac comorbidities, anticoagulants within 3 days of the index procedure (excluding up to 100 mg aspirin (acetylsalicylic acid), other medical condition or comorbidity contraindicative for TURP or PUL, unwilling to report sexual function
	Total number of participants randomly assigned: 91
	Group A (PUL)
	Number of all participants randomly assigned: 45
	• Age (mean ± SD): 63 ± 6.8 years
	• Prostate volume (mean $\pm$ SD): 38 $\pm$ 12 mL
	<ul> <li>PSA (mean ± SD): 2.4 ± 1.8 ng/mL</li> <li>IPSS (mean ± SD): 22 ± 5.7</li> </ul>
	• $Q_{max}$ (mean ± SD): 9.2 ± 3.5 mL/second
	Group B (TURP)
	Number of all participants randomly assigned: 46
	• Age (mean ± SD): 65 ± 6.4 years
	• Prostate volume (mean ± SD): 41 ± 13 mL
	<ul> <li>PSA (mean ± SD): 2.6 ± 2.1 ng/mL</li> <li>IDSS (mean ± SD): 2.6 ± 5.0</li> </ul>
	<ul> <li>IPSS (mean ± SD): 23 ± 5.9</li> <li>Q<sub>max</sub> (mean ± SD): 9.5 ± 3.2 mL/s</li> </ul>
Interventions	Group A: PUL
	PUL involved transurethral placement of small, permanent UroLift implants to retract the lateral lobes of the prostate and reduce obstruction. Typically, multiple implants are placed to deobstruct the pro- static urethra. Surgeons' experiences with PUL varied from 0 to 20 procedures before enrollment.
	Group B: TURP
	Licensed urologists trained and experienced in TURP conducted procedures in accordance with their own normal standards and practices.

Insausti 2020 (Continued)		
Blinding of participants and personnel (perfor- mance bias) Subjective outcomes	High risk	Quote: "There was no blinding of clinicians or patients due to the nature of the trial."
Blinding of outcome as- sessment (detection bias) Subjective outcomes	High risk	Quote: "There was no blinding of clinicians or patients due to the nature of the trial."
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Judgement: objective outcomes are likely not affected by lack of blinding.
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	High risk	Judgement: 23/31 (74.1%) and 22/30 (73.3%) participants randomized in PAE and TURP were included in the analysis, respectively (short term).
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	Low risk	Judgement: all randomized participants were included in the analysis.
Incomplete outcome data (attrition bias) Erectile function	Low risk	Judgement: all randomized participants were included in the analysis.
Incomplete outcome data (attrition bias) Ejaculatory function	Low risk	Judgement: all randomized participants were included in the analysis.
Incomplete outcome data (attrition bias) Acute urinary retention	Low risk	Judgement: all randomized participants were included in the analysis.
Incomplete outcome data (attrition bias) Indwelling catheter	Unclear risk	Judgement: no information given (not measured, narrative statement)
Selective reporting (re- porting bias)	High risk	Judgement: protocol was published, but study outcomes were not identical with the outcomes pre-specified in protocol.
Other bias	Low risk	Judgement: BPH medication was prescribed for a longer time in the PAE group, however, it may not have affected results at 12 months after treatment.

## Larson 1998

Study design: prospective, randomized parallel study.
<u>Study dates</u> : September 1994 to June 1996
Setting: outpatient, multicenter, national
Country: United States

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Larson 1998 (Continued)

Participants

Inclusion criteria: men with:

- 45-85 years old
- Symptomatic BPH confirmed by Digital Rectal Examination (DRE) and Trans Rectal Ultrasound (TRUS)
- Q<sub>max</sub> ≤ 12 mL/s with voided volume ≥ 125 mL on at least two clinic visits within 30 days of study enrollment
- AUA (American Urological Association) symptom score ≥ 9
- 3-5-cm preprostatic urethral length as determined by cystoscopy or TRUS
- No disproportionately enlarged or prominent prostatic median lobe on cystoscopy
- Life expectancy  $\geq$  1 year
- Informed written consent

Exclusion criteria: men with:

- UTI within 1 week of study enrollment as diagnosed by positive urine culture
- Gross haematuria not due to BPH
- Acute urinary retention
- Prostate weight > 100 g
- Use of alpha-antagonists within 4 wk or antiandrogens within 3 months of study enrollment
- Concomitant medications that could affect study outcome measures
- Coexisting disease that could mimic obstructive bladder neck syndrome
- Coexisting illness or specific obstructive symptoms caused by neurogenic bladder; bladder stones; renal failure; cardiac failure; prostate cancer; urethral stricture (i.e., inability to pass 22F urethroscope easily); severe bladder neck contracture; bladder cancer; urinary sphincter abnormalities; prostatitis; or hepatic failure
- Continuous or intermittent urinary catheterization within 2 weeks of the study procedure
- Previous prostate surgery or non-medical treatment for BPH other than balloon dilation ≤ 12 mo before study entry
- Penile implant or artificial urinary sphincter
- Previous pelvic or rectal surgery that would increase patient risk or render study procedures more difficult
- Metallic implants in the pelvic area
- Cardiac pacemaker
- Desire for future offspring
- Likely noncompliance with study follow-up evaluation requirements

Total number of participants randomized: 169

Group 1: n = 125 transurethral microwave thermotherapy (TUMT)

- Age, mean (95% CI): 66.0 (64.7-67.4) years.
- Prostate volume (cc), mean (95% Cl): 38.1 (35.1-41.2)
- PSA (ng/mL), mean (95% Cl): 3.4 (2.7-4.1)
- AUA score, mean (95% CI): 20.8 (19.8-21.9)
- Q<sub>max</sub> (mL/s), mean (95% CI): 7.8 (7.4-8.2)

## Group 2: n = 44 Sham

- Age, mean (95% CI): 65.9 (63.4-68.3) years.
- Prostate volume (cc), mean (95% Cl): 44.7 (38.8-50.5)
- PSA (ng/mL), mean (95% Cl): 3.6 (2.2-5.1)
- AUA score, mean (95% CI): 21.3 (19.3-23.3)
- Q<sub>max</sub> (mL/s), mean (95% CI): 7.8 (7.00-8.6)

Interventions

<u>Group 1 (n = 125)</u>: Transurethral Microwave Thermotherapy (TUMT) power was applied in increments to achieve a target urethral temperature of  $40 \pm 1$  °C with measurement by the catheter's fiberoptic

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Larson 1998 (Continued)	
	thermosensor. Microwave treatment was administered continuously for 1 hour, with the circulation of coolant at 8 °C.
	<u>Group 2 (n = 44)</u> : The same procedure as TUMT group, with the exception that microwave power was not applied, and coolant temperature was increased in increments from 8 to 20 °C over the same time period as microwave power was increased in the microwave group. It was not feasible to increase the urethral temperature further in the sham group because the Targis cooling system is not designed or equipped to provide active heating of coolant other than that occurring as the result of the application of microwave energy. The sham-group patients experienced rising urethral temperatures rather than unchanging low temperatures.
	<u>Co-interventions</u> : All participants underwent insertion of a Targis (formerly T3) transurethral thermoab- lation system treatment catheter (Urologix, Inc., Minneapolis, Minn). It is a compact and portable unit equipped with a 21F silicone treatment catheter containing a helical dipole microwave antenna op- erating in the range 902 to 928 MHz. This provides urethral cooling via circumferential cooling com- partments and also includes a urine drainage canal and a fiberoptic thermosensor for monitoring ure- thral catheter interface temperatures. The thermoablation system automatically interrupts microwave power if urethral temperatures reach 44.5 °C or higher or rectal temperatures reach 42.5 °C or higher. Catheterization was carried out under topical lidocaine anaesthesia. The positioning of the catheter balloon and antenna was confirmed by TRUS. The catheter was then secured in the proper spatial ori- entation with respect to the posteroanterior prostatic axis. A rectal thermal unit equipped with five thermocouples was used to monitor rectal temperatures. All participants received a 3-day prescription of prophylactic oral antibiotics and catheterization for 36 to 60 hours.
Outcomes	Urologic symptom scores
	How measured: AUA score
	Time points measured: baseline, 6 weeks, 3 months, and 6 months
	Time points reported: baseline, 6 weeks, 3 months, and 6 months
	Subgroups: none
	Quality of Life
	<u>How measured</u> : QOL score was evaluated by patient responses to the question of how they would feel if their current urinary symptoms were to continue indefinitely.
	Time points measured: Baseline and 6 months
	<u>Time points reported</u> : baseline, 6, 9, and 12 months follow-up (these last two time points were not re- ported In group 2)
	Subgroups: none
	Minor and major adverse event
	<u>How measured</u> : number of patients with UTI confirmed by urine culture and resolved with antibiotics, among other adverse events.
	Time points measured: not reported
	Time points reported: not reported
	Subgroups: none
	Retreatment
	How measured: number of patients requiring other treatment within the 6 months follow-up.
	Time points measured: 6 months
	<u>Time points reported</u> : 6 months

	<u>Group B</u> (sham)
	Number of men randomized: 61
	• Age in years (mean ± SD): 62.9 ± 7.0
	• Prostate volume in mL (mean ± SD): 44.5 ± 13.3
	• PSA in ng/mL (mean ± SD): 2.0 ± 1.6
	• IPSS (mean ± SD): 21.9 ± 4.7
	• Qmax in mL/s (mean ± SD): 10.4 ± 2.1
	• PVR in mL (mean ± SD): 82 ± 51.5
	OP time: NR
Interventions	<u>Group A:</u> Rezūm
	Thermal treatment procedure was performed using the Rezūm system, including a generator contain- ing an RF power supply, system controls and a single-use transurethral delivery device that incorpo- rates a standard 4 mm, 30 degree cytoscopy lens.
	<u>Group B:</u> Sham procedure
	Insertion of a rigid cystoscope and the Rezūm System generator. The device was activated by the inves- tigator's staff to generate similar sensations to the participant's body.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

McVary 2016 (Continued)

Outcomes

### Urologic symptom scores

How measured: IPSS score

<u>Time points measured</u>: before the procedure and at follow-up visits (at 2 weeks, and 1, 3, 6, 12, 24, 36 months)

<u>Time points reported</u>: before the procedure and at follow-up visits (at 2 weeks, and 1, 3, 6, 12, 24, 36 months)

Subgroups: IPSS severity

### Quality of life

How measured: IPSS-QoL / BPH Impact Index II

<u>Time points measured</u>: before the procedure and at follow-up visits (at 2 weeks, and 1, 3, 6, 12, 24, 36 months)

<u>Time points reported</u>: before the procedure and at follow-up visits (at 2 weeks, and 1, 3, 6, 12, 24, 36 months)

Subgroups: IPSS severity

### **Erectile function**

How measured: IIEF-15

<u>Time points measured</u>: before the procedure and at follow-up visits (at 2 weeks, and 1, 3, 6, 12, 24, 36 months)

<u>Time points reported</u>: before the procedure and at follow-up visits (at 2 weeks, and 1, 3, 6, 12, 24, 36 months)

Subgroups: IPSS severity

## **Ejaculatory function**

How measured: MSHQ-EjD

<u>Time points measured</u>: before the procedure and at follow-up visits (at 2 weeks, and 1, 3, 6, 12, 24, 36 months)

<u>Time points reported</u>: before the procedure and at follow-up visits (at 2 weeks, and 1, 3, 6, 12, 24, 36 months)

Subgroups: IPSS severity

### Retreatment

How measured: participants with a surgical procedure at follow-up

Time of measurement: NR but likely for follow-up period

Time of reporting: likely cumulative incidence

Major and minor adverse events (including acute urinary retention and indwelling catheter)

How measured: adjudicated by independent evaluation committee

Time of measurement: NR but likely for follow-up period

Time of reporting: likely cumulative incidence

Funding sources NxThera Inc., Maple Grove, Minnesota

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

## McVary 2016 (Continued)

Declarations of interest	Several co-authors had direct financial interest or relationships described as 'other' with NeoTract and NxThera as the device manufacturer.
Notes	The study was unblinded at three months and patients crossed-over (we did not include data after un- blinding).
	Protocol:ClinicalTrial.gov (NCT01912339)

Language of publication: English

## **Risk of bias**

-

Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Low risk	Quote: "randomized with an electronic program before treatment using per- muted blocks of random sizes, stratified by investigational site".
		Judgement: appropriate method of sequence generation.
Allocation concealment (selection bias)	Low risk	Quote: "randomized with an electronic program before treatment using per- muted blocks of random sizes, stratified by investigational site".
		Judgement: not explicitly described, but likely central randomization with al- location concealment.
Blinding of participants and personnel (perfor- mance bias) Subjective outcomes	High risk	Quote: "Study participants and study personnel administering questionnaires were double-blinded until the 3-month follow-up The treating physician was not blinded in order to perform the treatments but did not participate in the follow-up or the administration of outcomes questionnaires."
		Judgement: personnel were not blinded (surgeon: could not feasibly be).
Blinding of outcome as- sessment (detection bias) Subjective outcomes	Low risk	Quote: "Study participants and study personnel administering questionnaires were double-blinded until the 3-month follow-up An independent data mon- itoring committee reviewed safety. All AEs reviewed were adjudicated by an in- dependent clinical evaluation committee."
		Judgement: the outcomes grouped here are either self-assessed by the partic- ipant or refer to adverse event assessment. For both types of outcomes, the study provides assurance of blinding.
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Judgement: blinding deemed not relevant to these outcomes.
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	Low risk	Judgement: almost all randomized men were included in the analyses for all reported outcomes.
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	Low risk	Judgement: almost all randomized men were included in the analyses for all reported outcomes.
Incomplete outcome data (attrition bias) Retreatment	Low risk	Judgement: almost all randomized men were included in the analyses for all reported outcomes.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Cochrane
Library

McVary 2016 (Continued)		
Incomplete outcome data (attrition bias) Erectile function	High risk	Quote: "At baseline, 32% (43 of 134) of the observed treatment subjects and 33% (20 of 61) of control subjects were not sexually active (reported "did not attempt intercourse") within the past 4 weeks and were eliminated from the primary sexual function analyses."
		Judgement: 90/136 (66.1%) and 40/61 (65.5%) men in experimental and con- trol group were included in the analysis (subjects who reported no sexual in- tercourse were excluded from the analysis for sexual function: concern over prognostic imbalance).
		Comment: analyses of these outcomes were based on a non-random subset of men.
Incomplete outcome data (attrition bias) Ejaculatory function	High risk	Quote: "At baseline, 32% (43 of 134) of the observed treatment subjects and 33% (20 of 61) of control subjects were not sexually active (reported "did not attempt intercourse") within the past 4 weeks and were eliminated from the primary sexual function analyses."
		Judgement: 90/136 (66.1%) and 40/61 (65.5%) men in experimental and con- trol group were included in the analysis (subjects who reported no sexual in- tercourse were excluded from the analysis for sexual function: concern over prognostic imbalance).
		Comment: analyses of these outcomes were based on a non-random subset of men.
Incomplete outcome data (attrition bias) Acute urinary retention	Low risk	Judgement: almost all randomized men were included in the analyses for all reported outcomes.
Incomplete outcome data (attrition bias) Indwelling catheter	Low risk	Judgement: almost all randomized men were included in the analyses for all reported outcomes.
Selective reporting (re- porting bias)	Low risk	Judgement: all outcomes prespecified in the protocol (NCT01912339) were reported and analyzed as planned.
Other bias	Low risk	Judgement: not detected.

## Nawrocki 1997

Study characteristics	
Methods	Study design: prospective, randomized parallel study.
	Study dates: not reported
	<u>Setting</u> : outpatient, single center, national
	<u>Country</u> : United Kingdom
Participants	Inclusion criteria: men with symptoms of lower urinary tract dysfunction due to benign enlargement of the prostate meriting surgical treatment $Q_{max} < 15 \text{ mL/s}$ and voided volume $\ge 150 \text{ mL}$ and a maximum detrusor pressure $\ge 70 \text{ cm H}_2O$ .
	Exclusion criteria: men with:
	Complications of bladder outlet obstruction

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Nawrocki 1997 (Continued)

- Urinary retention
- Residual urine volume > 350 mL
- Renal failure
- Recurrent urinary tract infection
- Bladder calculus
- Bladder diverticulum
- Suspicion of malignancy
- Clinical features suggestive of malignancy
- DRE suspicious of malignancy
- Abnormal PSA level
- Short prostate (< 30 mm on TRUS)
- Presence of a prominent middle lobe projecting asymmetrically into the bladder
- Presence of a urethral stricture
- Previous prostate or pelvic surgery or radiotherapy
- Presence of metal within the lower trunk or upper legs
- Uncontrolled cardiac dysrhythmias or presence of a cardiac pacemaker
- Presence of neurological disorders that might affect the lower body
- Inability to understand the investigations, treatment procedure or give fully informed consent
- Presence of other treatment/medication which might affect lower urinary tract function

#### Total number of participants randomized: 120

Age, median (range): 70 (56-80) years (no disaggregated data by group available)

Group 1: n = 38 transurethral microwave thermotherapy (TUMT)

AUA score, median(range): 19 (7-31)

Qmax, mean (SD): 8.83 (2.32) mL/s

Prostate volume, mean (SD): 41.2 (14.6) mL

<u>Group 2: n = 40 sham transurethral microwave thermotherapy (TUMT)</u>

AUA score, median(range): 17.5 (7-28)

Qmax, mean (SD): 9.44 (2.78) mL/s

Prostate volume, mean (SD): 46.7 (16.8) mL

Group 3: n = 42 no treatment

AUA score, median(range): 18 (10-29)

Qmax, mean (SD): 8.79 (2.66) mL/s

Prostate volume, mean (SD): 46.4 (19.9) mL

InterventionsGroup 1 (n = 38): TUMT was delivered for an hour under local anaesthesia, through a urethral catheter.<br/>The temperature was measured through the catheter and a rectal probe and guided the cooling of the<br/>urethra through a software (Prostasoft v2.0) which was not under the control of the operator.

<u>Group 2 (n = 40)</u>: A technically identical procedure to standard TUMT with no microwaves, with similar noise and appearance with simulated heat using a heat pad.

<u>Group 3 (n = 42)</u>: No treatment (they received treatment after completion of the study).

Co-interventions: not reported

Outcomes

Urologic symptom scores

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Declarations of interest	Not available	
Notes	We included that TUMT	and sham arm of these studies in our review.
Risk of bias		
Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Low risk	The investigators describe a random component in the sequence generation process.
		Ouote: "Randomization was carried out by selecting one of three differently

Quote: "Randomization was carried out by selecting one of three differently numbered but otherwise identical balls from a sealed bag."

Allocation concealmentHigh riskThe allocation could be tampered considering that the balls could be re-insert-<br/>ed to the bag and pulled out again.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Nawrocki 1997 (Continued)		Quote: "Randomization was carried out by selecting one of three differently numbered but otherwise identical balls from a sealed bag."
Blinding of participants and personnel (perfor- mance bias)	Low risk	Blinding of participants and key study personnel ensured, and unlikely that the blinding could have been broken.
Subjective outcomes		Quote: "The treatment of the standard and simulated TUMT groups was de- signed and carried out as a double-blind, so that neither the operator nor the patient was aware of which treatment was being per- formed. Patients ran- domized to group 3 were treated after completion of the study"
Blinding of outcome as- sessment (detection bias) Subjective outcomes	Low risk	Blinding of outcome assessment ensured, and unlikely that the blinding could have been broken.
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Blinding of outcome assessment ensured, and unlikely that the blinding could have been broken.
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	Low risk	No apparent missing outcome data.
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	Low risk	No apparent missing outcome data.
Incomplete outcome data (attrition bias) Acute urinary retention	Low risk	No apparent missing outcome data.
Incomplete outcome data (attrition bias) Indwelling catheter	Unclear risk	Not fully measured (narrative statement).
Selective reporting (re- porting bias)	Unclear risk	No protocol available. There is a trial registry (ISRCTN24866285), however it was retrospectively registered and there is no information regarding the out-comes.
Other bias	Low risk	No other sources of bias were identified.

	<u>Country</u> : Denmark	
Participants	Inclusion criteria: symptomatic benign prostatic hyperplasia (BPH) and	
	• Age ≥ 50 years	
Minimally invasive treat	ments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis	110

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Norby 2002 (Continued)

- IPSS≥7
- QoL≥3
- Obstructed according to ICS nomogram or Qmax (free uroflowmetry) < 12 mL/s</li>
- Able to understand project information
- Written consent

Exclusion criteria: men with:

- Suspicion of prostate cancer
- Postvoid residual volume (PVR) > 350 mL or urinary catheter
- Prostatic urethra < 25 mm long
- Neurological diseases or diabetes with abnormal cystometry
- Previous prostate operation
- Ongoing UTI Previous diagnosis of rectal cancer
- Intake of medication known to influence voiding
- Severe peripheral arterial insufficiency
- Previous pelvic radiation therapy
- General health condition contraindicating surgery

Total number of participants randomized: 118

Group 1: 48 Interstitial laser coagulation (ILC)

- Age, mean (SD): 65 (8) years
- Serum creatinine, mean (SD): 97 (13) μmol/L
- Median prostate volume, Median (IQR): 44 (33-58) mL
- PSA, Median (IQR): 2.3 (1.7-6.3) ng/mL
- Qmax, mean (SD): 10.2 (4.0) mL/s

#### Group 2: 46 transurethral microwave thermotherapy (TUMT)

- Age, mean (SD): 66 (7) years
- Serum creatinine, mean (SD): 99 (13) μmol/L
- Median prostate volume, Median (IQR): 43 (35-79) mL
- PSA, Median (IQR): 3.3 (1.4-5.7) ng/mL
- Qmax, mean (SD): 9.1 (4.2) mL/s

#### Group 3: 24 (control: TURP or TUIP)

- Age, mean (SD): 68 (7) years
- Serum creatinine, mean (SD): 99 (20) μmol/L
- Median prostate volume, Median (IQR): 44 (35-50)mL
- PSA, Median (IQR): 2.2 (1.5-4.1) ng/mL
- Qmax, mean (SD): 9.6 (3.2)mL/s

```
Interventions
```

<u>Group 1 (n = 48)</u>: "ILC was delivered by a MediLas 4100 Fibertom (Dornier, Germany), a Nd-YAG laser with a wavelength of 1064 nm. The energy was delivered using an applicator with a quartz glass tip (length 20 mm, diameter 1.9 mm). The 3-min radiation was used, thus applying 20 W for 30 s, 15 W for 30 s, 10 W for 30 s and 7 W for 90 s. Treatments were undertaken with a laser cystoscope (18 F) using saline as the irrigant. The fibre was placed deep within the lateral lobes at an angle in the plane of the urethra of a 30° (to avoid heating the urethral mucosa). If a median lobe was present it was treated with one or two punctures in the direction of the bladder. Initially the intent was to apply one puncture per 10 mL of prostate tissue, but later the regimen became more aggressive, aiming at one puncture per 5 mL. All patients had a suprapubic tube placed at the start of the procedure and most also had a transurethral catheter for 12-24 h to reduce prostatic oedema. All patients received prophylactic antibiotics. Patients were discharged after removing the urethral catheter and scheduled to visit the outpatient clinic for removal of the suprapubic tube, generally at fixed intervals of 1-2 weeks."

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Norby 2002. (cachieve)         Group 2 (n = 46): "TUNT was administered using the Prostators" system; before treatment cycloscopy was used to exclude bladder pathology. Prostasot V.20 was chosen when the prostatic volume was > 30 mL and V.25 in larger prostates. Treatment comprised in Sessions under local anaesthesia with in- stallager! (Farce-Pharma GmbH, Cologne, Germany): In beforehand, 100 mg of dicidence and 500 mg         cipoflocacin was administered. During treatment patholine was given in treasany. If patients devel-         oped uninary reterition after treatment as suprapuble or a transurchinal catheer was insected and the         patient seen at weakly intervals unit genomatic open transurchinal catheer was insected and the         patient seen at weakly intervals unit genomatic open transurching proximal to the bladder         med, and extending distally to the verumontanum. After surgery a three- way irrigation catheter was in-         serted and first removed when bledding had stopped. Prophylactic antibiotics were given according to         the routine of the department."         Co-interventions: "All treatments were administered by one of the two consultants or the senior regis-         tra's. Patients were treated under spinal or general anaesthesia." Funding sources	The study was support	ed by a grant from Vejle County, Denmark.	
Declarations of interest	Not available		
Notes	2:1:1: Randomization -	ILC group data is not included in this review.	
	Antibiotic regimen in Il	_C group was changed during the study because there was a high rate of UTI.	
	"The study had to be stopped at the final date because of financial restrictions."		
Risk of bias			
Bias	Authors' judgement	Support for judgement	
Random sequence genera- tion (selection bias)	Unclear risk	Quote: "A weighted randomisation was therefore chosen as the object was to gain maximum information about the new treatments."	
		Insufficient information about the sequence generation process to permit judgement of 'Low risk' or 'High risk'.	
Allocation concealment (selection bias)	Unclear risk	Quote: "Patients were recruited from two centres and randomized at a 2 : 2: 1 to TUMT, ILC or the control group."	

a definite judgement.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis

Method of allocation concealment is not described in sufficient detail to allow

No blinding, and the outcomes are likely to be influenced by lack of blinding.

High risk

Blinding of participants

and personnel (perfor-

mance bias)

Norby 2002 (Continued)

Trusted evidence. Informed decisions. Better health.

Blinding of outcome as- sessment (detection bias) Subjective outcomes	High risk	No blinding, and the outcomes are likely to be influenced by lack of blinding.
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	No blinding, but the outcomes ar not likely to be influenced by lack of blinding
Incomplete outcome data (attrition bias)	Low risk	Quote: "Analyses are presented on an intention-to-treat basis".
Urologic symptom scores/ Quality of life		<u>Group 1</u> : "Before ILC but after randomisation two patients had prostate can- cer diagnosed and one had a urethral stricture. A further two patients declined surgery. One of these patients completed the IPSS at 6 months by mail con- tact. Thus, 44 patients were available for evaluation at 6 months."
		<u>Group 2</u> : "All patients were followed at 6 months except one who developed an apoplexy at 4 months. One patient had TURP."
		<u>Group 3</u> : "23 of 24 patients were treated according to the randomisation. One patient declined surgery. Two patients were excluded as the pathology revealed T1 prostate cancer."
Incomplete outcome data	Low risk	Quote: "Analyses are presented on an intention-to-treat basis".
(attrition bias) Major adverse events/mi- nor adverse events		<u>Group 1</u> : "Before ILC but after randomisation two patients had prostate can- cer diagnosed and one had a urethral stricture. Incomplete outcome data (attrition bias) Indwelling catheter	Unclear risk	Not fully measured (narrative statement).
Selective reporting (re- porting bias)	Unclear risk	No protocol available. Insufficient information to permit judgement of 'Low risk' or 'High risk'.
Other bias	Low risk	The study appears to be free of other sources of bias.

#### **Pisco 2020**

Study characteristics		
Methods	Study design: parallel randomized controlled study	
	Dates when study was conducted: September 2014 to March 2018	
	<u>Setting:</u> single center/ National	
	<u>Country</u> : Portugal	
Participants	<u>Inclusion criteria:</u> men over 45 years old; diagnosis of LUTS/BPH based on clinical history, digital rec- tal examination, urinalysis, transrectal ultrasound, and PSA; severe LUTS defined, in a screening and in a baseline visit two weeks apart, by an IPSS of 20 and a QoL score of 3 after a minimum of six months treatment with alpha-blockers for LUTS/BPH; Qmax < 12 mL/s; prostate volume 40 mL.	

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

# Pisco 2020 (Continued)

Exclusion criteria: men with computed tomography angiography showing that prostatic arteries were not feasible for PAE; previous surgical or invasive prostate treatments such as TURP, transurethral microwave therapy, transurethral needle ablation, laser, or any other minimally invasive treatment; acute or chronic prostatitis or suspected prostatitis including chronic pain, intermittent pain, or abnormal sensation in the penis, testis, anal, or pelvic area in the previous 12 months; history of prostate or bladder cancer or pelvic irradiation; active or recurrent urinary tract infections (more than one episode in the previous 12 months); history of neurogenic bladder or LUTS secondary to neurologic disease; advanced atherosclerosis and tortuosity of iliac and prostatic arteries; secondary renal insufficiency (due to prostatic obstruction); large bladder diverticula or stones; detrusor failure; previous history of acute urinary retention; current severe, significant, or uncontrolled disease; bleeding disorder such as hemophilia, clotting factor deficiency, anticoagulation, or bleeding diathesis; hypersensitivity or contraindication to tamsulosin use; mental condition or disorder that would interfere with the patient's ability to provide informed consent; participation in a study of any investigational drug or device in the previous three months; and administration of the 5-alpha reductase inhibitors, finasteride and dutasteride, in the previous six and three months, respectively. The latter criterion was changed by a protocol amendment to the administration of the 5-alpha reductase inhibitors, finasteride and dutasteride, in the previous two weeks and four months, respectively (these patients may be included if they stop those medications and replace them for tamsulosin, alfuzosin, or silodosin for at least two weeks and four months, respectively).

Interventions	<u>Group 1 (n = 147) TUMT</u>
	The Dornier Urowave (second-generation microwave therapy device), can deliver up to 90 W of power and has an integrated water-cooling circuit. The safety threshold was set at 50 °C in the urethra and at 42.5 °C in the rectum.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Roehrborn 1998 (Continued)

Continued)	<u>Group 2 (n = 73) Sham:</u> sham-treated patients received a 60-minute, preprogrammed sham treatment cycle with the catheter in place.			
	<u>Co-interventions</u> : All patients had negative urine cultures before treatment and were given peritreat- ment antibiotic prophylaxis (investigators' choice). After treatment, an indwelling Foley catheter was inserted and left in place for 2 to 5 days, depending on logistics.			
Outcomes	Urologic symptom scores			
	How measured: AUA-SI (0 to 35 points)			
	Time points measured: baseline, 1, 3, and 6 months.			
	Time points reported: baseline, 1, 3, and 6 months.			
	Subgroups: none			
	Quality of Life			
	How measured: AUA-SI subscore (0 to 6 points)			
	Time points measured: baseline, 1, 3, and 6 months.			
	Time points reported: baseline, 1, 3, and 6 months.			
	Subgroups: none			
	Major and minor adverse events (including ejaculatory and erectile function)			
	<u>How measured</u> : Adverse events were solicited from patients during and after treatment as well as at each follow-up visit. Adverse events were designated as treatment related or unrelated to treatment by the investigator.			
	Time points measured: during treatment, 72 h after treatment and up to 6 months			
	Time points reported: during treatment, 72 h after treatment and up to 6 months			
	Subgroups: none			
	Acute urinary retention			
	How measured: not reported			
	Time points measured: baseline, 1, 3, and 6 months.			
	Time points reported: 6 months.			
	Subgroups: none			
	Relevant outcomes not reported in this study			
	<ul> <li>Retreatment</li> <li>Indwelling urinary catheter: not applicable since "an indwelling Foley catheter was inserted and left in place for 2 to 5 days, depending on logistics." (all participants)</li> </ul>			
Funding sources	Funded by Dornier MedTech, Atlanta, Georgia			
Declarations of interest	Not available			
Notes	A secondary report states that quality of life was also measured by another scale (0-21), however, it is not clear which scale was used.			
Risk of bias				

Risk of bias

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

#### Roehrborn 1998 (Continued)

Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Low risk	The investigators describe a random component in the sequence generation process.
		Quote: "The physician administering the treatment opened the centrally pro- vided randomization envelope immediately before treatment."
Allocation concealment (selection bias)	Low risk	Participants and investigators enrolling participants could not foresee assign- ment.
		Quote: "The physician administering the treatment opened the centrally pro- vided randomization envelope immediately before treatment."
Blinding of participants and personnel (perfor-	Low risk	Blinding of participants and key study personnel was ensured, and it was un- likely that the blinding could have been broken.
mance bias) Subjective outcomes		Quote: "They were made aware that in this trial there would be an active/sham randomization at a ratio of 2:1. Furthermore, patients were made aware that a "subset" of patients would have interstitial temperature monitoring by way of inserting a needle through the perineum into the prostate. However, for ethical reasons, only actively treated patients received such monitoring. Thus, the patients were effectively blinded as to whether or not they underwent active or sham treatment despite the fact that only the actively treated patients had interstitial temperature monitoring."
Blinding of outcome as- sessment (detection bias)	Low risk	Blinding of participants and key study personnel was ensured, and it was un- likely that the blinding could have been broken.
Subjective outcomes		Quote: "The treating physician and assistant were excluded from the follow-up evaluation of the patient. The physician and/or nurse involved in the follow-up evaluation was not present in the room during treatment."
Blinding of outcome as- sessment (detection bias)	Low risk	Blinding of participants and key study personnel was ensured, and it was un- likely that the blinding could have been broken.
Objective outcomes		Quote: "The treating physician and assistant were excluded from the follow-up evaluation of the patient. The physician and/or nurse involved in the follow-up evaluation was not present in the room during treatment."
Incomplete outcome data (attrition bias)	Unclear risk	Insufficient reporting of attrition/exclusions to permit judgement of 'Low risk' or 'High risk'.
Urologic symptom scores/ Quality of life		Quote: "For the various parameters, between 124 and 130 of the actively treat- ed patients (86% to 88%) were available for 6-month follow-up; in the sham- treated group, between 65 and 67 (89% to 92%) of patients were available for 6-month follow-up."
Incomplete outcome data (attrition bias)	Unclear risk	Insufficient reporting of attrition/exclusions to permit judgement of 'Low risk' or 'High risk'.
Major adverse events/mi- nor adverse events		Quote: "For the various parameters, between 124 and 130 of the actively treat- ed patients (86% to 88%) were available for 6-month follow-up; in the sham- treated group, between 65 and 67 (89% to 92%) of patients were available for 6-month follow-up."
Incomplete outcome data (attrition bias)	Unclear risk	Insufficient reporting of attrition/exclusions to permit judgement of 'Low risk' or 'High risk'.
Erectile function		Quote: "For the various parameters, between 124 and 130 of the actively treat- ed patients (86% to 88%) were available for 6-month follow-up; in the sham-

Ejaculatory function		Quote: "For the various parameters, between 124 and 130 of the actively treat- ed patients (86% to 88%) were available for 6-month follow-up; in the sham- treated group, between 65 and 67 (89% to 92%) of patients were available for 6-month follow-up."
Incomplete outcome data (attrition bias) Acute urinary retention	Unclear risk	Insufficient reporting of attrition/exclusions to permit judgement of 'Low risk' or 'High risk
		Quote: "For the various parameters, between 124 and 130 of the actively treat- ed patients (86% to 88%) were available for 6-month follow-up; in the sham- treated group, between 65 and 67 (89% to 92%) of patients were available for 6-month follow-up."
Incomplete outcome data (attrition bias) Indwelling catheter	Unclear risk	Not applicable (pre-defined by protocol — only narrative statement).
Selective reporting (re- porting bias)	Low risk	No protocol available. Insufficient information to permit judgement of 'Low risk' or 'High risk'.
Other bias	Low risk	No other sources of bias were identified.

## Roehrborn 2013

Study characteristics	
Methods	Study design: multicentre randomized blinded trial
	Dates when study was conducted: February to December 2011
	<u>Setting:</u> multicentre / International / outpatient
	<u>Countries</u> : 19 centres in US 14, Canada 2, Australia 3
Participants	<u>Inclusion criteria:</u> men aged ≥ 50 years, provided informed consent, had no prior surgical treatment for BPH, and were required to undergo washouts of 2 weeks for alpha-blocker, 3 months for 5a-reductase inhibitor, and 3 days for anticoagulants. Admission to the study required ≥ IPSS 13, Q <sub>max</sub> ≤ 12 mL/sec-ond with a 125 mL voided volume and a 30- to 80-mL prostate volume
	<u>Exclusion criteria:</u> median lobe obstruction, retention, postvoid residual volume > 250 mL, active infec- tion, PSA > 10 ng/mL (unless negative biopsy), cystolithiasis within 3 months, and bacterial prostatitis within 1 year
	Total number of participants randomly assigned: 206
	Group A (PUL)
	<ul> <li>Number of all participants randomly assigned: 140</li> <li>Age (mean ± SD): 67 ± 8.6 years</li> <li>Prostate volume (mean ± SD): 44.5 ± 12.4 mL</li> <li>PSA (mean ± SD): 2.4 ± 2.0 ng/mL</li> <li>IPSS (mean ± SD): 22.2 ± 5.48</li> </ul>

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Roehrborn 2013 (Continued)	
	• Q <sub>max</sub> (mean ± SD): 8.9 ± 2.2 mL/second
	<u>Group B (Sham)</u>
	Number of all participants randomly assigned: 66
	<ul> <li>Age (mean ± SD): 65 ± 8.0 years</li> <li>Prostate volume (mean ± SD): 40.9 ± 10.8 mL</li> </ul>
	<ul> <li>Prostate volume (mean ± SD): 40.9 ± 10.8 mL</li> <li>PSA (mean ± SD): 2.1 ± 1.6 ng/mL</li> </ul>
	• IPSS: 24.4 ± 5.75
	• $Q_{max}$ (mean ± SD): 8.8 ± 2.2 mL/second
Interventions	Group A: PUL
	Transprostatic adjustable UroLift implants are permanently implanted to retract obstructing lateral lobes and expand the urethral lumen. After rigid cystoscopy is performed, the implant delivery device is inserted into the 20-F sheath. Under cystoscopic visualization using a 2.9 mm 0-degree lens, the de- livery device is angled anterolaterally to compress the obstructive lobe. A 19-gauge needle, housing a monofilament with metallic tab, is then deployed through the prostate lobe. As the needle is retract- ed, the tab engages the prostate capsule and the monofilament is tensioned. Finally, the urethral end- piece is attached to the monofilament, which is then cut, delivering the in situ-sized implant.
	Group B: sham
	Conducted with as similar an experience as possible to PUL.
	Follow-up: 3 months
Outcomes	Urologic symptom scores
	<u>How measured</u> : Reduction in IPSS at 3 months after the PUL procedure was ≥ 25% greater than that of sham
	Time points measured: at baseline, 2 weeks, 1 month, and 3 months
	Time points reported: at baseline, 2 weeks, 1 month, and 3 months
	Subgroups: none
	Quality of Life
	How measured: IPSS-QoL BPH II
	Time points measured: at baseline, 2 weeks, 1 month, and 3 months
	Time points reported: at baseline, 2 weeks, 1 month, and 3 months
	Subgroups: none
	Erectile function
	How measured: IIEF
	Time points measured: at baseline, 2 weeks, 1 month, and 3 months
	Time points reported: at baseline, 2 weeks, 1 month, and 3 months
	Subgroups: none
	Ejaculatory function
	How measured: MSHQ-EjD
	Time points measured: at baseline, 2 weeks, 1 month, and 3 months

126

Roehrborn 2013 (Continued)		
	Time points reported: at baseline, 2 weeks, 1 month, and 3 months	
	Subgroups: none	
	Retreatment	
	How measured: number of participants requiring surgery	
	Time points measured: not reported	
	Time points reported: likely cumulative incidence	
	Subgroups: none	
	Major and minor adverse events (including acute urinary retention)	
	How measured: adverse events	
	Time points measured: not reported	
	Time points reported: 3 months	
	Subgroup: none	
	Relevant outcomes not reported in this study	
	Indwelling urinary catheter

Declarations of interest	NeoTract, Fe/Male Health Centre	
Notes	Protocol: NCT01294150	
	Language of publication: English	

**Risk of bias** 

Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Low risk	Quote: "Randomization was conducted just before treatment using permut- ed blocks of various sizes chosen at random through a central electronic data program."
Allocation concealment (selection bias)	Low risk	Quote: "concealed through password protected electronic database pro- gram."
Blinding of participants and personnel (perfor- mance bias) Subjective outcomes	High risk	Judgement: we contacted with author, and they clarified the blinding of par- ticipants and outcome assessor. The personnel were not blinded.
Blinding of outcome as- sessment (detection bias) Subjective outcomes	Low risk	Quote: "An independent data monitoring committee assessed safety, and all AEs were adjudicated and assessed by an independent clinical events commit- tee A double-blind was maintained through the 3-month end point with the patient and questionnaire administrator blinded to randomisation. Blinding of participants was tested upon discharge and at each follow-up to 3 months."
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Judgement: objective outcomes were not likely affected by lack of blinding.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Roehrborn 2013	(Continued)
----------------	-------------

Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	Low risk	Judgement: all participants who were randomized were included in analysis.
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	Low risk	Judgement: all participants who were randomized were included in analysis.
Incomplete outcome data (attrition bias) Retreatment	Low risk	Judgement: all participants who were randomized were included in analysis.
Incomplete outcome data (attrition bias) Erectile function	Low risk	Judgement: 132/140 (94.2%) of randomized participants in PUL and 65/66 (98.4%) in sham groups were included in the analysis.
Incomplete outcome data (attrition bias) Ejaculatory function	High risk	Judgement: 94/140 (67.1%) of randomized participants in PUL and 50/66 (75.7%) in sham groups were included in analysis.
Incomplete outcome data (attrition bias) Acute urinary retention	Low risk	Judgement: all participants who were randomized were included in analysis.
Incomplete outcome data (attrition bias) Indwelling catheter	Unclear risk	Judgement: not described in the study or protocol (described in a narrative statement).
Selective reporting (re- porting bias)	Low risk	Judgement: review outcomes were prespecified in the protocol (NCT01294150) and were analyzed as planned.
Other bias	Low risk	Judgement: not detected.

#### Venn 1995

Study characteristic	s
Methods	Study design: prospective, randomized study.
	Study dates: not reported
	Setting: outpatient, multicenter center, national
	<u>Country</u> : United Kingdom
Participants	Inclusion criteria: men with:
	Madsen score > 8
	Urodynamic evidence of BOO
	Residual urine volumes < 250 mL
	Predominantly lateral lobe enlargement
	No evidence of prostate or bladder cancer
	No previous surgery on the lower urinary tract
	Exclusion criteria: not reported

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

## Venn 1995 (Continued)

Total number of participants randomized: 96

#### Group 1: n = 48 Transurethral microwave hyperthermia

- Age (years) 70.5
- Madsen score 12.7
- AUA score 19.2
- AUA bothersome score 11
- Urinary flow rate (mL/s) 11.5
- Prostatic volume (cm3) 40.4

## \* no SD or 95% CI reported

## Group 2: n = 48 transurethral sham

- Age (years) 68
- Madsen score 13
- AUA score 20.1
- AUA bothersome score 12.3
- Urinary flow rate (mL/s) 10.2
- Prostatic volume (cm3) 40.6

\* no SD or 95% CI reported

Interventions	<u>Group 1 (n = 48) TUMT</u>		
	Patients in the treated group underwent 1 h of microwave hyperthermia, with a maximum urethral temperature of 46 °C or a maximum rectal temperature of 42.5 °C. The machine was designed and con- structed in conjunction with Microwave Engineering Designs, Newport, Isle of Wight, UK (434MHz, max- imum power of 50 W). The antenna was a helical coil, loaded in a modified eyeless 22F Foley Simplastic catheter fitted with water cooling.		
	<u>Group 2 (n = 48) Sham</u>		
	Treated with the same procedure but without the use of heat.		
	Co-interventions:		
	After selection for inclusion in the trial a treatment catheter was inserted under antibiotic cover (gen- tamicin 80 mg).		
Outcomes	Urologic symptom scores		
	How measured: Madsen score. AUA score and AUA bothersome score.		
	Time points measured: baseline, 3 and 6 months		
	Time points reported: baseline, 3 and 6 months		
	Subgroups: none		
	Relevant outcomes not reported in this study		
	Quality of life		
	Retreatment		
	Ejaculatory function		
	Erectile function		
	Major and minor adverse events		

- Acute urinary retention
- Indwelling urinary catheter

Funding sources	Not available
Declarations of interest	Not available
Notes	Patients were selected from waiting lists for transurethral resection of the prostate (TURP) at St Thomas's Hospital and Worthing Hospital, or by direct referral.
	<b>Cross-over:</b> after 3 months, 47 patients in the treated group and 46 of the controls were assessed. After 6 months, 42 treated patients and 20 control patients were assessed, because 24 patients in the control group had been made aware of the sham treatment and so were not included in the analysis.
	Protocol: not available.

Language of publication: English.

## Risk of bias

Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Low risk	The investigators describe a random component in the sequence generation process.
		Quote: "patients were then randomly assigned to either a treated or control group by selection of sealed envelopes prepared before the trial."
Allocation concealment (selection bias)	Unclear risk	Participants and investigators enrolling participants could not foresee assign- ment, although it is not clear if the envelopes were opaque.
		Quote: "patients were then randomly assigned to either a treated or control group by selection of sealed envelopes prepared before the trial."
Blinding of participants	Unclear risk	It is unclear if personnel was blinded (first three months).
and personnel (perfor- mance bias) Subjective outcomes		Quote: "The patients were not aware of the group to which they were as- signed."
Blinding of outcome as-	Low risk	These outcomes are likely to be affected by blinding.
sessment (detection bias) Subjective outcomes		Quote: "The patients were not aware of the group to which they were as- signed."
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	These outcomes are unlikely to be affected by blinding.
		Quote: "The patients were not aware of the group to which they were as- signed."
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	Low risk	All outcomes: outcome data was available for nearly all participants. After 3 months, 47/48 patients in the treated group and 46/48 of the controls were assessed (6 month data not included in this review, see "notes").
Selective reporting (re- porting bias)	Unclear risk	No protocol available. Insufficient information to permit judgement of 'Low risk' or 'High risk'.
Other bias	Low risk	No other sources of bias were identified.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

## Wagrell 2002

Study characteristics	
Methods	Study design: prospective, randomized study
	<u>Study dates</u> : October 1998 to November 1999
	Setting: outpatient, multicenter center, international
	Country: Scandinavia and United States of America
Participants	Inclusion criteria: men with:
	<ul> <li>symptomatic BPH</li> <li>International Prostate Symptom Score (IPSS) of 13 or greater</li> <li>prostate volume of 30 to 100 mL</li> <li>and peak urinary flow rate (Qmax) less than 13 mL/s</li> </ul>
	Exclusion criteria: not reported
	Total number of participantsrandomized: 154
	<u>Group 1: n = 103 Microwave Treatment</u>
	<ul> <li>Age, mean (SD): 67 (8) years</li> <li>Weight, mean (SD): 133 (15) kg</li> <li>Height, mean (SD): 178 (6) cm</li> <li>Residual urine volume, mean (SD): 106 (77) mL</li> <li>Detrusor (voiding) pressure, mean (SD): 73.7 (29.7) cm H2O</li> <li>Maximal free urinary flow rate, mean (SD): 7.6 (2.7) mL/s</li> <li>PSA, mean (SD): 3.3 (2.2) g/L</li> <li>Prostate volume as determined by TRUS, mean (SD): 48.9 (15.8) cm3</li> <li>IPSS, mean (SD): 21.0 (5.4)</li> <li>Bother score, mean (SD): 4.3 (1.0)</li> <li>Group 2: n = 51 Transurethral resection of the prostate</li> <li>Age, mean (SD): 69 (8) years</li> <li>Weight, mean (SD): 81 (11) kg</li> <li>Height, mean (SD): 177 (6) cm</li> <li>Residual urine volume, mean (SD): 94 (82) mL</li> <li>Detrusor (voiding) pressure, mean (SD): 79.4 (35.3) cm H2O</li> <li>Maximal free urinary flow rate, mean (SD): 7.9 (2.7) mL/s</li> <li>PSA, mean (SD): 3.6 (2.7) g/L</li> <li>Prostate volume as determined by TRUS, mean (SD): 52.7 (17.3) cm3</li> <li>IPSS, mean (SD): 20.4 (5.9)</li> <li>Bother score, mean (SD): 4.2 (1.1)</li> </ul>
Interventions	<u>Group 1 (n = 103)</u> TUMT ProstaLund Feedback measured temperatures and were continuously displayed on the device comput er. Using the heat equation, the device also calculates the extent of the coagulation necrosis continu- ously during the treatment, stopping at 55 °C.
	<u>Group 2 (n = 51):</u> TURP
	TURP was performed as a clinical standard inpatient procedure according to the routines at each cen- ter.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Wagrell 2002 (Continued)	<u>Co-interventions</u> : A washout period of at least 6 weeks preceded the treatment for patients who had been using any alpha-receptor blocker or finasteride.		
Outcomes	Urologic symptom scores		
	How measured: International Prostate Symptom Score (IPSS)		
	Time points measured: baseline, 3, 6, 12, 24, 36, 48, and 60 months.		
	Time points reported: baseline, 3, 6, 12, 24, 36, 48, and 60 months.		
	Subgroups: none		
	Quality of Life		
	How measured: QoL domain of IPSS score		
	Time points measured: baseline, 3, 6, 12, 24, 36, 48, and 60 months.		
	Time points reported: baseline, 3, 6, 12, 24, 36, 48, and 60 months.		
	Subgroups: none		
	Mayor adverse events		
	<u>How measured</u> : All adverse events occurring during the entire study period were reported. A serious adverse event was defined according to International Congress on Harmonization as any untoward medical event that resulted in death, was life-threatening, required inpatient hospitalization or prolongation of existing hospitalization, resulted in persistent or significant disability or incapacity, was cancer, or required intervention to prevent permanent damage to body functions or structure.		
	Time points measured: during treatment and up to 12 months.		
	Time points reported: during treatment and up to 12 months.		
	Subgroups: none		
	Minor adverse events (includes acute urinary retention and erectile dysfunction)		
	How measured: not reported		
	Time points measured: during treatment or up to 12 months, and from 12 to 60 months.		
	Time points reported: during treatment or up to 12 months, and from 12 to 60 months.		
	Subgroups: none		
	Indwelling urinary catheter		
	How measured: time with the catheter		
	Time points measured: after the procedure		
	Time points reported: after the procedure		
	Subgroups: none		
	Retreatment		
	How measured: number of participants with additional medical or surgical treatment		
	Time points measured: after the procedure		
	Time points reported: after the procedure		
	<u>Subgroups</u> : none		

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Wagrell 2002 (Continued)	Relevant outcomes not reported in this study <ul> <li>Ejaculatory dysfunction</li> </ul>
Funding sources	Funded by ProstaLund.
Declarations of interest	Wagrell L, Schelin S, Larson TR, and Mattiasson A were paid consultants to the sponsor of this study.
Notes	A total of 154 patients were included on an intention-to-treat basis. Eight patients (5 in the TURP and 3 in the PLFT group) were withdrawn before treatment, resulting in a total of 146 treated patients; 100 in the PLFT arm and 46 in the TURP arm.

## **Risk of bias**

Bias	Authors' judgement	Support for judgement
Random sequence genera- tion (selection bias)	Unclear risk	Insufficient information about the sequence generation process to permit judgement of 'Low risk' or 'High risk'.
Allocation concealment	Unclear risk	Insufficient information to permit judgement of 'Low risk' or 'High risk'.
(selection bias)		Quote: "The randomisation ratio between PLFT and TURP was 2:1."
Blinding of participants and personnel (perfor-	High risk	Whereas blinding was not mentioned, the interventions were visibly differen (surgery versus outpatient procedure).
mance bias) Subjective outcomes		The subjective outcomes were likely to be influenced by lack of blinding.
Blinding of outcome as- sessment (detection bias)	High risk	Whereas blinding was not mentioned, the interventions were visibly differen (surgery versus outpatient procedure).
Subjective outcomes		The subjective outcomes were likely to be influenced by lack of blinding.
Blinding of outcome as- sessment (detection bias)	Low risk	Whereas blinding was not mentioned, the interventions were visibly differen (surgery versus outpatient procedure).
Objective outcomes		The objective outcomes were unlikely to be influenced by lack of blinding.
Incomplete outcome data (attrition bias)	Low risk	12 months: balanced attrition, and outcome data was available for 133/154 (86%).
Urologic symptom scores/ Quality of life		Judgement: low risk of bias (short term).
		<u>24 months:</u> outcome data was available for 79/103 in the TUMT group and 39/51 in the TURP group (76%).
		<u>36 months:</u> outcome data was available for 69/103 in the TUMT group and 35/51 in the TURP group.
		<u>60 months:</u> outcome data was available for 62/103 in the TUMT group and 34/51 in the TURP group.
		Judgement: high risk of bias (long term).
Incomplete outcome data (attrition bias) Major adverse events/mi- nor adverse events	Low risk	12 months: balanced attrition, and outcome data was available for 133/154 (86%).
		Judgement: low risk of bias (short term data only).

Allocation concealment (selection bias)	Unclear risk	Judgement: not described.
Blinding of participants and personnel (perfor- mance bias) Subjective outcomes	High risk	Judgement: not described; blinding highly unlikely to have taken place.
Blinding of outcome as- sessment (detection bias) Subjective outcomes	High risk	Judgement: not described; blinding highly unlikely to have taken place.
Blinding of outcome as- sessment (detection bias) Objective outcomes	Low risk	Judgement: objective outcomes are likely not affected by lack of blinding.
Incomplete outcome data (attrition bias) Urologic symptom scores/ Quality of life	Low risk	Judgement: all randomized participants were included in the analysis (short term).
Incomplete outcome data (attrition bias) Acute urinary retention	Low risk	Judgement: all randomized participants were included in the analysis (short term).
Selective reporting (re- porting bias)	Unclear risk	Judgement: study outcomes were well pre-defined and described, but proto- col was not found.
Other bias	Low risk	Judgement: not detected.

**BPH:** benign prostatic hyperplasia; **ICS male IS-SF:** International Continence Society short-form male questionnaire; **IIEF-15:** International index of erectile function; **IPSS:** International Prostate Symptom Score; **MSHQ-EJD;** Male sexual health questionnaire for ejaculatory dysfunction; **NA:** not available; **NR:** not reported; **OAB-q SF:** Overactive bladder questionnaire short form; **PGI-I:** Patient Global Impression of Improvement; **PSA:** prostate specific antigen; **PUL:** prostatic urethral lift; **PVR:** post-void residual volume; **Q**<sub>max</sub>: maximum flow rate; **QoL:** quality of life; **SD:** standard deviation; **SF-6D:** Short-Form Six-Dimension; **SF-12:** 12-item Short-Form Health Survey; **TURP:** transurethral resection of prostate; **VAS:** visual analogue scale.

# Characteristics of excluded studies [ordered by study ID]

Study	Reason for exclusion
Albala 2000	Ineligible intervention (Variant technique: periurethral); cross-over at 3 months with no inter- pretable outcome data.
Arai 2000	Prospective observational study comparing TUMT with other modalities.
Bagla 2017	Irrelevant study design (retrospective chart review for cost analysis).
Bilhim 2015	Letter to editor.
Brown 2018	Irrelevant study design (retrospective comparative study).
D'Ancona 1997	Observational non-comparative study.
Dahlstrand 2003	Review article (full-text assessment).
Djavan 1999	Ineligible comparison: TUMT ± neoadjuvant alpha-blocker.
Gratzke 2018	Wrong study design: single arm study for prostatic urethral lift.
Hahn 2000	Observational study on cardiovascular complications of TUMT.
Hansen 1998	Methods paper on the symptoms scores. The TUMT data come from an observational study.
ISRCTN23921450	"Please note that this trial was terminated due to poor recruitment."
Kobelt 2004	Economic data only from the Wagrell 2002 trial.
Lim 2011	Case series of a temporary nitinol device.
Mulvin 1994	Non-randomized comparative study of TUMT and transurethral catheter therapy.
NCT01835860	Irrelevant study design (single group assignment).
Norby 2002b	Economic data only of the Nørby 2002a study.
Nørby 2004	Review article (full-text assessment).
Ohigashi 2007	Prospective observational study comparing TUMT with other modalities.
Pereira 2018	Irrelevant study design (retrospective comparative study).
Porpiglia 2015	Single-arm study of the first-generation TIND device.
Porpiglia 2019	Single-arm study of the second-generation TIND device.
Qiu 2017	Irrelevant study design (retrospective comparative study).
Russo 2015	Irrelevant comparator (open simple prostatectomy).
Schelin 2006	Ineligible comparison: Compares TUMT to a group of participants that underwent TURP and enu- cleation surgery (no disaggregated data available).
Servadio 1987	Observational study of the use of TUMT for various diseases of the prostate.

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Study	Reason for exclusion
Shore 2010	Ineligible comparison: Compared 2 similar energy TUMT systems that differed only by an adjunct balloon dilator.
Tan 2005	Long-term follow-up of the sham crossed-over group. Ten out of 12 participants in the sham group had crossed over to the active treatment group and no disaggregated data were available for this group before crossing over.
Trock 2004	Pooled observational with previously extracted RCT data.
Vesely 2006	Non-randomized comparative study: participants were assigned by severity to TUMT or TURP.
Waldén 1998	Economic data only on the Dahlstrand 1995 study.
Woo 2018	Wrong study design (educational lecture).
Yachia 1996	Non-randomized comparison of two types of prostatic stents.
Zerbib 1992	Ineligible intervention: Transrectal hyperthermia.
Zerbib 1994	Ineligible intervention: Transrectal hyperthermia.

#### ACTRN12617001235392

Study name	PAE for patients with LUTS due to BPH
Methods	Study design: parallel randomized controlled trial (open label)
	Setting/Country: single center / New Zealand
Participants	Inclusion criteria
	Men were willing, able and mentally competent to provide written consent
	Men aged 40 years or older
	<ul> <li>Men with LUTS (IPSS &gt; 8, QoL &gt; 3)</li> </ul>
	<ul> <li>Men with prostate gland &gt; 40 mL on transabdominal ultrasound</li> </ul>
	<ul> <li>Men with vascular anatomy that in the opinion of the Interventional radiologist is amenable to PAE as assessed on CTA</li> </ul>
	<ul> <li>Men with adequate laboratory parameters: platelets &gt; 100, INR &lt; 1.5, bilirubin &lt; 2, albumin &gt; 2.5 estimated glomerular filtration rate &gt; 60</li> </ul>
Interventions	Group A: PAE
	Group B: TURP
Outcomes	Primary outcome
	Change in IPSS
	Successful trial of voiding after removal catheter
	Secondary outcomes
	Patient satisfaction evaluations as assessed by the IPSS

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Study name	Prostatic artery embolization versus 532 nm green light PVP for catheterized patients	
Methods	Study design: parallel randomized controlled trial (open label)	
	Setting/Country: multicenter / Canada	
Participants	Inclusion criteria:	
	• Male subjects, over 50 years of age at the time of enrollment	
	<ul> <li>Subjects referred to urology for BPH leading to permanent indwelling bladder catheters and are considered poor surgical candidates</li> </ul>	
	Written informed consent to participate in the study	
	Ability to comply with the requirements of the study procedures	
Interventions	Group A: PAE	
	Group B: Green light PVP	
Outcomes	Primary outcome	
	Ability of the patient to void after removal of the urethral catheter	
	Secondary outcomes	
	Patient subjective satisfaction evaluated by the IPSS	
	Degree of prostatic size reduction evaluated by MRI	
	Change in Q <sub>max</sub>	
	Change in PVR	
	Change in PSA	
Starting date	December 2013	
Contact information	mostafa.elhilali@muhc.mcgill.ca	
Notes	The recruitment status of this study is unknown. The completion date has passed and the status has not been verified in more than two years.

#### NCT02566551

Study name	Prospective controlled randomized study of PAE vs TURP for BPH treatment	
Methods	Study design: single (outcome assessor) blinded parallel randomized controlled trial	
	Setting/Country: single center / Spain	

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

NCT02566551 (Continued)	
Participants	Inclusion criteria:
	Patients evaluated in the Urology Service because of BPH, candidate to TURP.
	<ul> <li>Signed informed consent</li> <li>LUTS secondary to BPH for at least 6 months prior to study and/or baseline IPSS score &gt; 13 and/or acute urinary retention with impossibility to remove urinary catheter and/or BPH symptoms refractory to medical treatment or for whom medication is contraindicated, not tolerated or refused prostate size of at least 50 grams measured by MRI</li> <li>Patient must meet one of the following criteria: baseline PSA &lt; 4 ng/mL (no prostate biopsy required), baseline PSA &gt; 4 ng/mL and ≤ 10 ng/mL and free PSA &lt; 15% of total PSA (no prostate biopsy required), baseline PSA &gt; 4 ng/mL and ≤ 10 ng/mL and free PSA &lt; 15% of total PSA and a negative prostate biopsy result (minimum 12 core biopsy), baseline PSA &gt; 10 ng/mL and a negative prostate biopsy (minimum 12 core biopsy)</li> </ul>
Interventions	Group A: PAE
	Group B: TURP
Outcomes	Primary outcome
	Improvement of symptoms assessed by IPSS score
	Secondary outcomes
	<ul> <li>Improvement in QoL</li> <li>Duration of hospitalization post procedure</li> <li>Preservation of erectile function using the IIEF</li> </ul>
	Other outcomes
	<ul> <li>Change from baseline in Qmax</li> <li>Change from baseline in PVR</li> <li>Change from baseline in detrusor pressure</li> <li>Change from baseline in mean prostate volume, as determined by transrectal ultrasound</li> <li>Structural and morphological changes in MRI</li> <li>Change from baseline in PSA</li> <li>Overall adverse events</li> <li>Procedure related adverse events</li> </ul>
Starting date	October 2015

## NCT04178811

Study name

Comparison between Holmium laser enucleation and prostatic urethral lift in management of BPH

139

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

## NCT04178811 (Continued)

Methods	Study design: single (outcome assessor) blinded parallel randomized controlled trial
	Setting/Country: likely single center / Egypt
Participants	Inclusion criteria:
	• Age > 50 years
	Prostate volume 20-70 mL (on ultrasound)
	• IPSS > 12
	<ul> <li>Qmax &lt; 15 mL/s</li> </ul>
	• PVR < 350 mL
Interventions	Group A: Holmium laser enucleation
	Group B: prostatic urethral lift
Outcomes	Primary outcome
	• IPSS
Starting date	November 2020
Contact information	mostafamostafa@aun.edu.eg
Notes	Sponsor: Assiut University

## NCT04236687

Study name	PAE compared to Holmium laser enucleation of the prostate for BPH
Methods	Study design: parallel randomized controlled trial (open label)
	Setting/Country: single center / Spain
Participants	Inclusion criteria
	Patients evaluated in the urology department and candidates to surgical treatment
	• Age > 45 years
	• IPSS ≥ 10
	<ul> <li>Qmax &lt; 12 mL/s</li> </ul>
	• PVR < 300 mL
	Prostatic volume between 20 mL and 250 mL assessed by ultrasound
	Signed informed consent
Interventions	Group A: PAE
	Group B: Holmium laser enucleation of the prostate
Outcomes	Primary outcome
	Improvement of symptoms assessed by IPSS
	Secondary outcomes
	• Qmax
	• PVR

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

NCT04236687 (Continued)	<ul> <li>PSA</li> <li>Procedure related adverse events assessed by Clavien-Dindo modified score</li> <li>Procedure related effects on sexual function assessed by IIEF</li> <li>Procedure related effects on urinary continence assessed by the International Consultation on Continence Questionnaire Short Form</li> </ul>
Starting date	February 2020
Contact information	fagreda.germanstrias@gencat.cat
Notes	Sponsor: Hospital Universitari Germans Trias i Pujol

#### NCT04338776

Study name	Comparing UroLift experience against Rezūm (CLEAR)
Methods	Study design: parallel randomized controlled trial (open label)
	Setting/Country: not reported
Participants	Inclusion criteria
	Male gender
	<ul> <li>Age ≥ 50 years</li> </ul>
	Diagnosis of symptomatic BPH
	Prostate volume 30 mL to 80 mL
	Willing to sign study informed consent form
Interventions	Group A: UroLift (prostatic urethral lift)
	Group B: Rezūm (convective radiofrequency water vapor thermal therapy)
Outcomes	Primary outcome
	• Catheter Independent (number of subjects who are catheter independent post-operative day 4 and remain catheter independent through 1-week)
Starting date	August 2020
Contact information	emily.friedland@teleflex.com
Notes	Sponsor: NeoTract, Inc.

**BPH:** benign prostatic hyperplasia; **IIEF:** International Index of Erectile Function; **IPSS:** International Prostate Symptom Score; **LUTS:** lower urinary tract symptoms; **MRI:** magnetic resonance imaging; **PAE:** prostatic arterial embolization; **PSA:** prostate specific antigen; **PVR:** post void residual; **Q**<sub>max</sub>: maximum flow rate; **QoL:** quality of life; **TURP:** transurethral resection of prostate.

## DATA AND ANALYSES

# Comparison 1. Minimally invasive treatment versus TURP

Outcome or subgroup title	No. of studies	No. of partici- pants	Statistical method	Effect size
1.1 Urologic symptom scores	11		Mean Difference (IV, Random, 95% CI)	Subtotals only
1.1.1 PUL	1	76	Mean Difference (IV, Random, 95% CI)	-0.30 [-3.90, 3.30]
1.1.2 TUMT	4	304	Mean Difference (IV, Random, 95% CI)	3.44 [-0.16, 7.05]
1.1.3 PAE	6	369	Mean Difference (IV, Random, 95% CI)	2.42 [0.37, 4.47]
1.2 Urologic symptoms score (long term)	5		Mean Difference (IV, Random, 95% CI)	Subtotals only
1.2.1 TUMT	2	126	Mean Difference (IV, Random, 95% CI)	1.45 [-0.54, 3.44]
1.2.2 PUL	1	69	Mean Difference (IV, Random, 95% CI)	4.80 [1.11, 8.49]
1.2.3 PAE	2	176	Mean Difference (IV, Random, 95% CI)	2.58 [-1.54, 6.71]
1.3 Quality of life	7		Mean Difference (IV, Random, 95% CI)	Subtotals only
1.3.1 PUL	1	125	Mean Difference (IV, Random, 95% CI)	0.40 [-0.17, 0.97]
1.3.2 TUMT	1	125	Mean Difference (IV, Random, 95% CI)	0.40 [-0.17, 0.97]
1.3.3 PAE	5	309	Mean Difference (IV, Random, 95% CI)	0.25 [-0.75, 1.25]
1.4 Quality of life (long term)	4		Mean Difference (IV, Random, 95% CI)	Subtotals only
1.4.1 PAE	2	176	Mean Difference (IV, Random, 95% CI)	0.42 [-0.11, 0.95]
1.4.2 PUL	1	69	Mean Difference (IV, Random, 95% CI)	0.80 [0.07, 1.53]
1.4.3 TUMT	1	97	Mean Difference (IV, Random, 95% CI)	0.00 [-0.46, 0.46]
1.5 Major adverse events	11		Risk Ratio (M-H, Random, 95% CI)	Subtotals only
1.5.1 PUL	1	79	Risk Ratio (M-H, Random, 95% CI)	0.27 [0.03, 2.44]
1.5.2 TUMT	6	525	Risk Ratio (M-H, Random, 95% CI)	0.20 [0.09, 0.43]
1.5.3 PAE	4	301	Risk Ratio (M-H, Random, 95% CI)	0.67 [0.25, 1.76]
1.6 Retreatment (short term)	2		Risk Ratio (M-H, Random, 95% CI)	Subtotals only
1.6.1 TUMT	1	68	Risk Ratio (M-H, Random, 95% CI)	1.47 [0.06, 34.66]
1.6.2 PAE	1	60	Risk Ratio (M-H, Random, 95% CI)	9.76 [0.49, 194.21]
1.7 Retreatment (long term)	8		Risk Ratio (M-H, Random, 95% CI)	Subtotals only

Minimally invasive treatments for lower urinary tract symptoms in men with benign prostatic hyperplasia: a network meta-analysis (Review)

Date

Event

Description

10 November 2021 Amended

We ammended the abstract with post-publication feedback and we added information on the funding sources.

### HISTORY

Protocol first published: Issue 6, 2020 Review first published: Issue 7, 2021

### CONTRIBUTIONS OF AUTHORS

JVAF: conception and study design and drafting the protocol, data extraction and analysis, writing the full review.

JHJ: drafting the protocol, data extraction and analysis, writing the full review.

MI: drafting the protocol, providing clinical input and approving the final draft.

MB: drafting the protocol, providing clinical input and approving the final draft.

SY: revising the protocol, providing clinical input and approving the final draft.

MIO: drafting the protocol, providing clinical input and approving the final draft.

JG: providing clinical input and approving the final draft.

CMEL: creating search strategies and searching for trials, writing the methods and results section related to the searches and approving the final draft.

AAV: drafting the protocol, providing supervision on the statistics and approving the final draft.

LG: drafting the protocol, data extraction and analysis, writing the full review.

PD: conception and study design, providing clinical and methodological advice on the protocol.

# DIFFERENCES BETWEEN PROTOCOL AND REVIEW

### Outcomes

We analyzed the data for major adverse events using short-term and long-term data (i.e. studies with short-term and long-term follow-up) since most studies do not differentiate the timing for this outcome. With the consultation of experts, we inferred that most major adverse events occur at short-term follow-up. We did not add "short term" to the outcome because some adverse events (e.g. urethral stricture) occurred at long-term follow-up.

### **Selection of studies**

We used Covidence for de-duplicating results instead of EndNote 2016.

### **Measurement of treatment effect**

We had specified that we "will report outcome data from other scales separately in a narrative synthesis of quantitative data." Considering that outcome data in other scales (Madsen scores) were only available for one intervention and were fully reported in a supporting review (Franco 2021), we did not include the narrative synthesis in this review.

We had specified that we "will use the rank-heat plot to present SUCRA values for all outcomes in a single plot (Veroniki 2016)"; however, we decided to display them in the traditional format, using the package in Stata.

### **Data synthesis**

While in our protocol we specified methods for pairwise comparison, in order to avoid duplication with the supporting reviews of this network meta-analysis, we described only the pairwise comparisons for the data that could not be included in the network due to concerns about transitivity.

### 'Summary of findings' tables

We had planned to include a confidence interval for ranking, but we considered it inadequate, as we are using a frequentist approach that accounts for uncertainty in the ranking (Veroniki 2018). Therefore, we reported the 'probability of being the best' instead.

We had not specified in the protocol which would be the reference treatment when displaying effect estimates in 'Summary of findings' tables and for our main network meta-analyses. With the input of experts, we decided to display results regarding TURP, considering that this is the standard treatment for the condition.

### Methods not implemented

We could not perform network meta-analysis for all outcomes and time points due to the scarcity of data, especially long term results.

Copyright  ${\ensuremath{\mathbb C}}$  2021 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

We did not perform sensitivity analysis considering the lack of studies at low risk of bias for our outcomes.

We were unable to perform subgroup analysis for prostate size since only one study included participants with prostate size < 40 mL. Furthermore, we were unable to perform other subgroup analyses based on age and symptoms severity due to the scarcity of information (few trials included participants < 65 years and IPSS scores < 19; see Table 1).

### NOTES

We based portions of the Methods section of this review on a standard template developed by the Cochrane Metabolic and Endocrine Disorders Group, which was modified and adapted for use by Cochrane Urology. General concepts of benign prostatic hyperplasia and review methods have been adapted from one of the reviews from the suite on this topic (Franco 2021; Jung 2017; Jung 2019; Kang 2020).
