

1 **Title: Unforeseen emotional labour: a collaborative autoethnography exploring**  
2 **researcher experiences of studying Long COVID in health workers during the**  
3 **COVID-19 pandemic.**

4  
5 **Abstract**

6 Emotional labour or emotion management describes regulation of feelings to fulfil  
7 specific job roles, discussed extensively around commercial and caring professions  
8 and more recently qualitative researchers. During the COVID-19 pandemic, this was  
9 heightened due to changes in the socio-political context affecting individual  
10 circumstances and research practice, yet accounts pertaining to qualitative  
11 researchers are lacking.

12 This paper presents a collaborative autoethnographic account of the emotional labour  
13 experiences of researchers working on a longitudinal, mixed methods study on the  
14 lived experiences of healthcare workers with Long COVID in Scotland during the  
15 pandemic. The types, intensity and impacts of the emotional labour was unforeseen  
16 at the outset, rooted in a culmination of unique factors that transpired over time:  
17 circumstances pertaining to the socio-political context; the novelty, unpredictability and  
18 devastating nature and impacts of Long COVID illness; the levels of participant  
19 distress and their unfulfilled support needs. In response, researchers engaged in a  
20 range of types of emotion management - *Strategic emotion work*; *Emotional reflexivity*;  
21 *Emotion work to cope with emotive dissonance* and *Managing relationships*. This was  
22 additionally challenging given the already difficult homeworking and lockdown climate  
23 balancing workplace and personal responsibilities, and by the necessary use of  
24 remote methods for both data-gathering and interacting with colleagues, which  
25 impeded our ability to provide and receive support. Critically, emotional labour needs  
26 to be recognised, acknowledged and formal plans put in place to support researchers  
27 across individual, research team and institutional levels, with consideration of socio-  
28 political influences at the time of study.

32 Research; Long COVID, Collaborative Autoethnography.

33  
34 **1. Introduction and Background**

35 The concept of 'emotions' may be understood as cultural practices rather than merely  
36 bodily feelings or psychological states. Emotions are produced, shaped and circulated  
37 through interactions conducted in the public sphere and experienced through the body  
38 (Ahmed, 2004). Thus, emotions are not experienced universally but differ according  
39 to individual and collective relationships to certain feelings – and over time, across  
40 various contexts and interactions with different people. It is on this basis that  
41 'emotional labour' can be understood and explored.

42

43 The concept of emotional labour (as distinct from 'emotion work' which applies to the  
44 sphere of private life) was initially conceptualised to denote *'the management of*  
45 *feelings to create a publicly observable facial and bodily display...to fulfil a specific*  
46 *paid job role* (Hochschild, 1983, p.7), inducing or inhibiting feelings appropriate to a  
47 given situation, essentially to deliver customer satisfaction (Wilkinson & Wilkinson,  
48 2020). Emotional labour, however, is arguably more nuanced than presented in  
49 Hochschild's early analysis, and later work based mainly on the experiences of  
50 healthcare workers offered an evolved understanding of this concept and an  
51 alternative conceptualisation of emotion management in organisations (Bolton, 2001;  
52 Riley and Weiss, 2015). In terms of this, Bolton's (2001) work identified three  
53 distinctive faces employed by nurses to manage emotions: the 'professional' face  
54 (caring, yet distant to remain in control and for self-protection), the 'smiley' face (to  
55 placate dissatisfied 'customers' of the NHS, engendering resentment and loss of  
56 genuine caring) and the 'humorous' face (displayed 'off-stage', providing 'relief' from  
57 maintaining a professional or smiley face and expressed by shared smiles, sighs and  
58 sideways glances, or 'giving the gift' of extra emotion work to colleagues to process  
59 difficult feelings). Nurses move between and juggle these different faces and feeling  
60 rules depending on context. This work was further developed to include a typology of  
61 emotional self-management (Bolton & Boyd, 2003), showing how emotion in  
62 organisations is controlled by both employees and management in different ways.  
63 Even where constrained by organisational structures, individuals can employ different  
64 sets of 'feeling rules' (commercial, professional/ organisational and social) to match  
65 feeling and face with situation and ultimately determine how, where and why they  
66 manage social exchanges and their emotional responses. These types include  
67 'pecuniary' (akin to emotional labour with commercial feeling rules), 'presentational'  
68 (similar to emotional work with social feeling rules), 'prescriptive' (where employees

69 behaviour and responses are governed by professional/ organisational feeling rules),  
70 and 'philanthropic' (where organisational rules are implicit and behaviour is governed  
71 by social feeling rules) (Bolton & Boyd, 2003). Riley and Weiss (2015) extended work  
72 in this area in terms of: recognition of the 'professionalisation' of emotion and gendered  
73 aspects of emotional labour: discussion of intrapersonal aspects of emotional labour  
74 (how emotions are managed, and recognition of the positive or hidden aspects);  
75 collegial and organisational sources of emotional labour; as well as resulting support  
76 and training needs. Collectively, these accounts provide a much more comprehensive  
77 picture of how and why emotional labour manifests, how it is managed and what is  
78 required in terms of acknowledging and addressing the resulting needs ((Bolton, 2001;  
79 Bolton & Boyd, 2003; Riley and Weiss, 2015). Later accounts call into question,  
80 however, the extent to which emotional labour is recognised and valued in a  
81 healthcare context (Delgado, et al. 2020).

82

83 This concept is closely intertwined with Goffman's (1959) 'dramaturgical' perspective,  
84 forwarding the notion that social life is akin to a performance, consisting of 'frontstage'  
85 and 'backstage' regions, in which individuals display particular behaviours or 'present  
86 many faces' (Bolton, 2001) depending on their context and audience to create a  
87 certain impression for others. Frontstage, individuals perform or behave in ways  
88 deemed appropriate to a given situation, whilst backstage, an area free from audience  
89 intrusions, they drop their front and act more authentically.

90

91 Whether referred to as emotional labour or emotion management, since its inception  
92 this role has been studied and applied extensively across a range of professional  
93 groups in commercial roles, as well as healthcare workers, social workers and  
94 educators (a select few include studies by Kario, 2021; Moesby-Jensen & Schjellerup  
95 Nielsen, 2015; Newcomb, 2021). Whilst the last decade has witnessed a new interest  
96 in the emotional labour negotiated by qualitative researchers, comparatively this area  
97 has received less attention. Largely, the work undertaken has been rooted in a  
98 feminist paradigm, involved difficult or 'sensitive' subject areas such as male infertility  
99 (Carroll, 2012; Hanna, 2019), end-of-life care (Komaromy, 2020), gaining access to  
100 the judiciary (Bergman & Wettergren, 2015), and activist parents of autistic children  
101 (Lo Bosco, 2021), often utilising ethnographic methods. As asserted elsewhere, there  
102 is even less interest in those engaged in public health-related research (Scott, 2022).

103 Perhaps this is due to a historical resistance to 'researching the researcher' (Campbell,  
104 2001) and queries around if and how researchers should display their emotions. For  
105 instance, whether to openly demonstrate genuine feelings such as shock or sadness,  
106 or moderate these to maintain a perceived professional front, and the impact of these  
107 choices in building rapport and conveying empathy and understanding (Dickson-Swift  
108 et al, 2009; Hanna, 2019; Hughes, et al., 2022).

109 As an under-researched area, less is known about the normal, expected tasks of  
110 managing emotions and feelings within a research context. It has been suggested,  
111 however, this broadly involves behaving in ways appropriate to purpose and context  
112 (Komaromy, 2020), likely to include managing relationships with participants,  
113 colleagues and others such as gatekeepers; developing rapport, and critically  
114 reflecting on own experiences (Roy & Uekusa, 2020), as well as displaying empathy  
115 and detachment as appropriate (Hanna, 2019). This was further characterised in one  
116 study to involve: *Strategic emotion work* (developing trust and self-confidence);  
117 *Emotional reflexivity* (awareness of emotional signals); and *Emotion work to cope with*  
118 *emotive dissonance* (when performing in ways different to real feelings) (Bergman &  
119 Wettergren, 2015).

120 As the very nature of qualitative inquiry often involves highly sensitive, emotive subject  
121 areas, vulnerable people and likely emotional labour, this presents additional work,  
122 potential dilemmas, and risks to the wellbeing of the researcher (Moncur, 2013;  
123 Rogers-Shaw et al, 2021). Potential 'burdens' or negative 'outcomes' of undertaking  
124 emotional labour have been discussed elsewhere in relation to academic researchers  
125 as well as other professional groups, to include burnout, feelings of shame and guilt,  
126 depression, anxiety, poor job satisfaction, less personal accomplishment,  
127 gastrointestinal upset, exhaustion and insomnia (Kumar & Cavallaro, 2018; Dickson-  
128 Swift et al., 2009; Hochschild, 1983; Yang and Chen, 2021), though the degrees to  
129 which these are described varies across studies (Allen et al., 2014; Brotheridge &  
130 Grandey, 2002; Lee & Chelladurai, 2016; Pugliesi, 1999; Scott & Barnes, 2011;  
131 Wagner et al, 2014). These potential 'harms' have been found to be particularly  
132 apparent when performing to cope with role expectations, in ways incongruent with  
133 true feelings - termed 'cognitive dissonance' (Riley and Weiss, 2015), or disjuncture  
134 between 'feeling and face' elsewhere (Bolton and Boyd, 2003).

135 Moreover, these potential harms for the researcher may negatively impact on  
136 participants experiences (Rogers-Shaw et al., 2021). Despite this, it has been  
137 suggested that there is still a reluctance amongst researchers to acknowledge or  
138 express their emotional labour experiences, perhaps concerned this may degrade  
139 their sense of professionalism (Mallon & Elliott, 2019). It has been found, however,  
140 that suppressing such feelings heightens emotional labour whilst openly discussing  
141 these have cathartic benefits (Stonebridge, 2022). It may be queried, however,  
142 whether there is perhaps a growing movement towards recognising, sharing and  
143 supporting emotionally demanding research experiences, evidenced through the  
144 recent inception of bodies such as the 'Emotionally Demanding Research Network in  
145 Scotland', a peer support group set up by academics (Smillie, 2021), yet perhaps  
146 grant-funding constrains the ability to write-up these experiences for academic  
147 publication.

148 It is very likely that this emotional role and its implications was heightened even further  
149 for researchers during the COVID-19 global pandemic, due to changes in the social  
150 and political landscape at the time, as well as specific shifts pertaining to research.  
151 This pandemic resulted from a novel and potentially deadly coronavirus first  
152 discovered in 2019 and instigated – the construction and transmission of - mass public  
153 fear and challenges to social order - as identified in relation to other devastating and  
154 unexpected epidemics (Strong, 1990). This necessitated 'action' which included a  
155 range of measures to curb transmission: several national lockdowns; school closures;  
156 homeworking; social distancing and restrictions on movement and mixing with other  
157 households; mask-wearing in public spaces; and a mass vaccination programme.  
158 During this time, COVID-related studies were prioritised by funders, whilst research  
159 across other areas was stalled (Otto & Haase, 2022). Measures and restrictions  
160 presented both personal challenges to researchers, as well as practical and  
161 methodological challenges in conducting qualitative empirical studies as in-person  
162 contact and thus, face-to-face interviewing, was not possible (Otto & Haase, 2022).  
163 Collectively, these factors precipitated further change, uncertainty, stress, anxiety and  
164 disconnection. For instance, it has been suggested that "*Social distancing has  
165 encouraged isolation and seclusion. Researchers are now faced with many challenges  
166 associated with social distancing, such as a lack of daily interaction with peers and  
167 increased difficulty communicating with others*" (Hendrickson, 2020. p.1).

168 Further, remote working during the pandemic has been linked to an increased risk of  
169 vicarious trauma (VT) in professionals exposed to trauma including mental health  
170 workers (Roberts et al., 2022) and psychotherapists (Aafjes-van Doorn et al, 2020),  
171 resulting in feelings of anger, rage, sadness, guilt, shame and self-doubt, as well as  
172 lingering preoccupation about patients outside work. Arguably, this could be extended  
173 to qualitative researchers exposed to trauma through accounts of their study  
174 participants.

175 Despite this, there is a dearth of published work exploring researcher's emotional  
176 experiences during the COVID-19 pandemic – indeed, we could only locate two  
177 sources. Firstly, an online blog, reflecting on the authors emotional experiences whilst  
178 engaged in interviews with frontline healthcare workers early in the pandemic  
179 (Stonebridge, 2022) and secondly, a published paper, documenting researcher  
180 emotion and emotional labour experienced by the author whilst studying the impacts  
181 of the pandemic on young people (Scott, 2022). The blog acknowledged the burdens  
182 for researchers conducting 'emotionally-demanding' work when already dealing with  
183 lockdowns and social restrictions, likely personal concerns and potential lack of  
184 support (Stonebridge, 2022). The second elaborated more fully on these burdens to  
185 include pressures balancing home with work responsibilities and dealing with negative  
186 feelings and experiences, such as sadness, anxiety and fatigue.

187

188 In response to this dearth of literature on qualitative researcher's emotional labour  
189 experiences particularly during COVID times, we aim to draw on our reflections whilst  
190 working on a highly emotive study conducted during the pandemic, the 'Lived  
191 experience of long-term COVID-19 on workers in NHS healthcare settings in Scotland:  
192 a longitudinal mixed methods study' (*LoCH*). In this, we investigated the lived  
193 experience of NHS workers across Scotland living with Long COVID, that is '*signs and*  
194 *symptoms that continue or develop after acute COVID-19. It includes both ongoing*  
195 *symptomatic COVID-19 from 4 to 12 weeks and post-COVID-19 syndrome, 12 weeks*  
196 *or more*' (NICE, 2020). We aimed to establish the nature and extent of the impact on  
197 health and wellbeing, use of healthcare services, work, personal life and household  
198 finances. We conducted a mixed-methods, longitudinal study with data-collection  
199 spanning the period April 2021 to August 2022, using online questionnaire surveys  
200 and in-depth longitudinal qualitative interviews with a range of NHS workers including

201 healthcare professionals and ancillary staff. The qualitative aspect of the study, on  
202 which our emotional labour experiences are drawn, explored the experiences of fifty  
203 participants at two time points, via remote, individual semi-structured interviews.  
204 Participants reported a wide range of Long COVID symptoms including fatigue, brain  
205 fog, breathlessness, sleep disturbance, joint and muscle pain, neurological problems,  
206 and heart palpitations, as well as detrimental impacts on their day-to-day functioning,  
207 their ability to work or fully contribute at work, function at home or socially, or plan for  
208 the future.

209

210 It became very apparent at an early stage of interviewing that there was a high degree  
211 of emotional labour involved in managing interviews with participants, which we neither  
212 fully anticipated nor were prepared for at the outset. This was due to the level of  
213 distress participants expressed around their very traumatic illness experiences - the  
214 long-standing, unpredictable and devastating nature of their Long COVID symptoms  
215 and the impact across all domains of their lives, difficulties negotiating or accessing  
216 adequate formal and/ or informal support, and a lack of understanding or legitimisation  
217 of their illness. Many therefore used the interview context as an opportunity to seek  
218 reassurance or offload, often for the first time. Given the novelty of Long COVID at  
219 the time, the extent of these issues was unknown and thus, unimagined, and  
220 unexpected, leaving us unprepared for the enormity of our emotional experiences.  
221 Undertaking these distressing interviews was additionally challenging due to living and  
222 working through an unprecedented pandemic and the associated changes and  
223 challenges experienced personally and professionally. This included having to  
224 engage with others remotely (via MS Teams), which hampered our ability to provide  
225 or receive support to and from colleagues within the research team, an issue  
226 acknowledged elsewhere (Weir and Waddington, 2008). Homeworking also  
227 intensified our experiences of emotional labour due to the blurring of home and work  
228 boundaries, where difficult feelings leached into our home spaces. Whilst it is fully  
229 acknowledged that other difficult or sensitive research also carries heavy emotional  
230 loads and emotional labour, perhaps with similar features such as prolonged  
231 engagement in remote settings and absence of usual forms of support (e.g., Lo Bosco,  
232 2021), it was the combination and culmination of the factors outlined here that made  
233 our emotional labour experiences distinct.

234 By means of a collaborative autoethnographic account, this paper sets out consider  
235 and further reflect on these issues, specifically:

- 236 i. the integral role of the socio-political context in shaping experiences of  
237 unforeseen emotional labour borne by us, the researchers, whilst  
238 conducting fieldwork for this study.
- 239 ii. our experiences of emotional labour, how this presented, and the various  
240 of impacts on us.
- 241 iii. our coping strategies and responses.
- 242 iv. the key learning that aided our coping, emotion management, and  
243 successful project delivery.
- 244 v. the implications on future research practice around managing difficult  
245 subject matter in challenging conditions.

246 Goffman's dramaturgical perspective provides a useful lens for understanding and  
247 interpreting our emotional labour experiences, with reference to both ours and the  
248 participants presentation of self and our interactions, and thus, will be referred to  
249 throughout this paper. Additionally, a limitation of the theory pertaining to the blurring  
250 of divisions between front and backstage spaces due to the socio-political context at  
251 the time of study will be explored and thus, extend the theoretical perspective in  
252 relation to this novel area.

253 These issues will be explored as follows: firstly, the various standpoints of the  
254 researchers will be given; secondly the collaborative autoethnographic methodology  
255 and tools employed for data-collection and analysis, thirdly, key reflections around our  
256 emotional labour experiences; and lastly the implications of our findings and a pathway  
257 for future research practice to make use of our experiences.

258

### 259 1.1. Positioning Statement

260 We have included our positionalities as researchers and authors of this paper, to  
261 facilitate transparency around what we 'brought' to the research in way of our  
262 assumptions, beliefs and subjectivities (Rogers-Shaw et al., 2021; Roulston & Shelton,  
263 2015), and to illustrate how this may have influenced our experiences of emotional  
264 labour, as well as our analysis and interpretations of these.

265 Our core *LoCH* study team consisted of four researchers, with the majority of  
266 interviews conducted by research fellows EM and NA. Of the two more senior

267 experienced researchers and co-principal investigators, AG and NT, AG carried-out  
268 several interviews and both played an integral role in discussions and reflections  
269 around our emotional experiences whilst engaged in data-collection, and the peer  
270 support system we had in place.

271 EM, NA and AG are all social scientists. During the pandemic, EM and AG were  
272 balancing work with childcare, home-schooling and national lockdowns.

273

## 274 **2. Methods**

275 Within this section, the methodology adopted, collaborative autoethnography, and the  
276 specific tool utilised within this approach, namely journaling, will be described.

277

### 278 2.1. Data and Design - Collaborative Autoethnography

279 Autoethnography aims to describe, systematically analyse and connect personal  
280 experiences to the broader social context (Ellis et al, 2011), with the researcher  
281 occupying the unique dual roles as both the object of, *and* the subject undertaking the  
282 investigation. (Anderson and Fourie, 2015).

283 Collaborative autoethnography was utilised, that is a 'multivocal' approach involving  
284 multiple researchers working collectively to share and interpret their pooled personal  
285 reflections (Alexandra et al, 2019; Wilkinson and Wilkinson, 2020). When embarking  
286 on '*LoCH*', we did not intentionally set out to undertake an autoethnographic account  
287 of our own experiences, however, it became apparent at an early stage of interviewing  
288 participants that this encompassed a high degree of emotional labour for us as  
289 researchers. This required careful negotiation of the emotions experienced to minimise  
290 the risk of harm to our wellbeing (and potentially the participants) and to ultimately  
291 enable us to continue with data-gathering towards successful completion of the study.  
292 This encompassed reflection and discussion amongst the research team around our  
293 feelings, experiences and needs, as well as mechanisms in place to support ourselves  
294 and each other. The idea of conducting a collaborative autoethnography grew  
295 organically through us managing our emotional labour. This approach enabled us to  
296 '*keep our own voices while creating a collective one*' (Anderson, 2015, p.) and offered  
297 a richer account of our experiences (Lapadat, 2017; Nowakowski & Sumerau, 2019).

298

299 Like others (e.g. Chang, 2016; Griffin & Griffin, 2019; Pearce, 2020), we have tried to  
300 marry the two traditional broad autoethnographic approaches of an 'analytic' slant, to  
301 ground the findings in context (Anderson, 2006), with an emotive 'evocative' style  
302 (Bochner & Ellis, 2016), integrated together to facilitate greater understanding,  
303 illuminate and reflect on our experiences, inform research practice and share our  
304 learnings (Anderson, 2000; Wilkinson & Wilkinson, 2020). Critically, reflexivity was  
305 threaded throughout the entire process and was fundamental to our interpretations,  
306 which is the *'back-and-forth movement between experiencing and examining a*  
307 *vulnerable self and observing and revealing the broader context of that experience'*  
308 (Ellis, 2007, p14), and aided in this case by the reflexive journaling tool we utilised. A  
309 multitude of tools are accepted within an autoethnographic methodology, including  
310 textual data, diaries/ journals, self-observations and reflections (Chang, 2008). We  
311 used reflexive journal writing (Fox, 2021), reflecting on our individual experiences  
312 though additionally informed by ongoing discussions amongst the research team, as  
313 will now be described.

314

### 315 2.1.2. The reflexive journal

316 The reflexive journal, a well-recognised tool in autoethnographic research, provides a  
317 written account of key details, observations, thoughts and feelings (Travers, 2011).  
318 EM, NA and AG were accustomed to using reflexive writing aiding everyday practice  
319 as researchers, to reflect on, make sense of and learn from experiences. During the  
320 fieldwork stage in 'LoCH', EM and NA both kept reflexive journals throughout the data-  
321 collection phases to add context to the research findings, noting and making sense of  
322 thoughts, feelings and emotions, as well as reflections based on discussions with  
323 colleagues from the wider research team, a process which was cathartic following  
324 particularly challenging, emotive interviews.

325

## 326 2.2. Data-Analysis

327 Journal entries containing both individual accounts and reflections on team  
328 discussions, was the primary data for this study, analysed via a reflexive and flexible  
329 approach utilising general thematic coding methods (Saldaña, 2016), particularly open

330 and descriptive coding, which enabled us to identify and describe our experiences and  
331 make sense of these in our own words. On both a practical and intellectual level, this  
332 involved re-reading journal entries, assigning codes to segments of these, then  
333 comparing, refining, reviewing and defining these, and eventually constructing three  
334 key themes based on these. This process was aided through constant questioning of  
335 the data as well as memoing interesting points and observations. Given the sensitive  
336 and personal nature of our journal entries, we revisited and managed initial coding  
337 individually, yet the process of developing themes and understanding the significance  
338 of these was managed collectively through team discussions, to generate joint  
339 understanding and limit the influence of individual biases. Again, reflexivity was at  
340 the core of this interpretative and analytic process, as revisiting journal entries  
341 reinvented emotional experiences and feelings, which served to aid sense-making  
342 around the data (Mauthner and Doucet, 2003).

343

### 344 2.3. Ethical Approval and Considerations

345 We had full ethical approval to proceed with the *LoCH* study (RGU SNMPP SERP 21-  
346 04). There are a number of other ethical concerns and queries pertaining to  
347 autoethnography which are noteworthy as relevant to our account: issues around  
348 generalisability and validity/ trustworthiness (Griffin & Griffin, 2019; Noble & Smith,  
349 2015); and confidentiality and consent (Anderson & Fourie, 2015; Ellis, 2007; Ngunjiri  
350 et al, 2010). Whilst the findings described and discussed here are not generalisable,  
351 nor aim to be, validity or trustworthiness can be best assessed by these being '*lifelike,*  
352 *believable and possible*' (Ellis, 2004:124). In terms of confidentiality and consent, we  
353 recognise our responsibility to protect the *LoCH* study participants. As part of the  
354 consent process all individuals agreed to their anonymised accounts appearing in  
355 published material, and we have referred as little as possible to specific individuals in  
356 this paper.

357

### 358 **3. Findings/ Our reflections - Navigating the Unforeseen: The Experiences and** 359 **Implications of Unexpected Emotional Labour**

360 Despite prior experience of interviewing vulnerable people for other highly emotive  
361 studies, the emotional toll and the emotional labour involved in *LoCH* was amplified  
362 and had a different quality to anything experienced before in a research context by  
363 any of the team. Analysis of our reflective journal accounts and discussions identified

364 three inter-related factors underpinning this, each an implication of the wider social  
365 and political context (and the COVID restrictions) at the time: firstly, the high degree  
366 of unsupported illness and emotional work undertaken by the participants; secondly,  
367 the data-collection method utilised, and thirdly, the systems of support in place for the  
368 research team. These factors, will be considered according to Bergman &  
369 Wettergren's (2015) work, extended with reference to other forms of emotion  
370 management already described (Bolton, 2001; Bolton & Boyd, 2003; Riley and Weiss,  
371 2015; Hanna, 2019; Roy & Uekusa, 2020). These are: *Strategic emotion work*  
372 (developing trust, rapport and self-confidence, as well as strategies to manage the  
373 impact of emotional labour); *Emotional reflexivity* (awareness of emotional signals and  
374 critically reflecting on own experiences); *Emotion work to cope with emotive*  
375 *dissonance* (when performing in ways different to real feelings); and *Managing*  
376 *relationships with participants and colleagues*.

377

### 378 3.1. The high degree of unsupported emotional work amongst participants and the 379 resultant experience of unexpected emotional labour

380 *"It was the first time she'd told anyone what she's going through...she thanked me for*  
381 *listening...I had a lump in my throat and felt shocked and saddened by her*  
382 *account...she seemed visibly lighter."* (EM journal entry, October 2021)

383

384 The source of our heavy and unexpected emotional loads was manifold. At the outset  
385 we underestimated the severity of Long COVID illness and the impacts on the  
386 individual and made a hypothesis that the participants as healthcare professionals  
387 were likely to be more equipped to navigate the healthcare system. These reflections,  
388 however, were inaccurate and further exacerbated the unexpected nature of our  
389 emotional reactions and resulting emotional labour. Participants were much sicker and  
390 for longer than we had anticipated, and commonly reported feeling worried, stressed,  
391 anxious and/or depressed because of their severe, long-standing, debilitating, and  
392 unpredictable symptoms, living with an uncertain prognosis, and the wide-ranging  
393 impacts across all domains of their lives and sense of self, as illustrated in the  
394 quotation below:

395 *"But this year, I've become quite anxious, teary, sometimes I'll be screaming, bawling*  
396 *at my husband and I think, this is no fair, this is not his fault...I have had really bad*  
397 *days, thinking I just don't want to live anymore...I just don't want to live like this, I said*

398 *to my husband, I'm just going to take all these tablets, I'm just going to take them all*  
399 *and be done. It's no fair on you, it's no fair on me, it's no fair on my son".* (Participant  
400 17, Nurse, Interview 2)

401 Many discussed their difficulties in managing their work the associated guilt around  
402 burdening colleagues and an already stretched health system, and the trauma of  
403 working in healthcare during the COVID pandemic, as illustrated below:

404 *"I felt really embarrassed that I couldn't do my job, and that my colleagues were*  
405 *carrying the weight for me...after one day, not even a full day at work at this point, I*  
406 *would sleep for a whole day [...] So, I've had to step down responsibilities at work. I*  
407 *don't feel I'm able to contribute as much to the team...I don't feel I'm able to contribute*  
408 *as much as I used to do...for a doctor, that's quite a lot of your identity is what you do".*  
409 (Participant 32, Medic, Interview 2).

410 Furthermore, many participants were shouldering the burden of these substantial  
411 emotional loads without adequate support from informal or formal sources. The  
412 COVID-19 restrictions on social distancing measures precluded direct contact  
413 amongst different households and minimised opportunities for social interaction with  
414 family and friends. Some were living alone, and many were either off work, working  
415 remotely or in a new role (more aligned to their needs or due to COVID-related NHS  
416 redeployment) without others around or with unfamiliar colleagues. Thus, usual  
417 'backstage' forms of support were perhaps less available (Goffman, 1959). Access to  
418 formal sources of support via employee NHS or other services was also variable, for  
419 instance across different health boards and services, or offered to individuals outside  
420 of their working hours.

421 Also, many participants reported difficulties accessing their GP and other sources of  
422 healthcare. Even where contact had been established, there was often a lack of  
423 recognition, understanding, belief and/ or legitimisation of their Long COVID (as an  
424 emerging condition), or inappropriate treatment, which discouraged some from  
425 pursuing further contact. Essentially, difficult feelings and emotions were produced  
426 through the absence of belief and support around Long COVID. The following  
427 quotation illustrate these concerns:

428 *“And by the time I phone, if it's a specific symptom...the neurological symptoms*  
429 *or...nausea...they focus on that one symptom...they don't see it as part of this whole*  
430 *picture of long COVID and how long it's been going on. And I just get snap decisions,*  
431 *you know ...speaking to a doctor, I've never, met before, who haven't had time to read*  
432 *the notes, I've just had a couple of minute phone conversation, and that's it”.*  
433 (Participant 16, Ancillary worker, Interview 1)

434 The interplay of these issues, together with a perceived lack of knowledge and  
435 understanding of Long COVID amongst others, meant that we were often the first and  
436 sole outlet for participants to share, offload or ‘talk through’ highly personal, difficult,  
437 traumatic, and shocking experiences and their Long COVID journey to date in its  
438 entirety. Engagement and retention for the study was particularly high – people were  
439 desperate to be heard and granted an opportunity to ‘tell their stories’. Additionally,  
440 due to difficulties accessing their GPs, many sought information and reassurance  
441 about medical issues and symptoms during the interviews (and often other  
442 participants’ symptoms), which we were neither qualified to answer, nor able to share.  
443 Arguably, we were de facto fulfilling multiple roles in the interviews, including  
444 confidante and GP. For example, NA’s journaling recounted an interview with a  
445 medical doctor where the conversation turned to poor mental health: *“I’m tired out at*  
446 *the end of this interview, [the doctor] has spoken for around an hour and a half, in*  
447 *detail about the traumas of having Long COVID and linked mental and physical ill-*  
448 *health, ongoing financial worries, and ‘letting go’ of their previously healthy identity. I*  
449 *mostly let them speak and didn’t interrupt with questions until they stopped. They held*  
450 *nothing back and let it all out and I think this was a very positive experience for them.*  
451 *At the end, they thanked me sincerely and said they were grateful we were prioritising*  
452 *the voices of those suffering. I don’t think they’d spoken like this about their experience*  
453 *before, or even had the opportunity. They were animated, upset, angry, frustrated – a*  
454 *spectrum of emotions. It’s ‘good’ data for our study, but I wonder if there was a*  
455 *consideration [when designing the protocol] for how hearing about these traumatic*  
456 *events could affect a researcher (particularly due to the high number of interviews*  
457 *we’re conducting), Also, I wonder if we are seen [by participants] solely as an outlet*  
458 *for their experiences in the absence of other opportunities to talk. What should I do*  
459 *with this information and how should I process this? I should have the opportunity to*  
460 *speak to someone about this and how I feel about this”* (NA, summary from notes,

461 November 2021). NA recalled thinking about the interview for a long time afterwards;  
462 wondering how the participant was coping now.

463

464 Whilst the research interview afforded cathartic benefits for the participants, the  
465 degree of raw emotion exhibited - distress, despair, and desperation - was unforeseen  
466 and intensified our emotional experiences. Our overriding feelings (perhaps 'caught'  
467 from the participants) were shock, anger and upset (at the degree of suffering and the  
468 lack of formal support available for participants). This necessitated various forms of  
469 emotion management, namely 'strategic emotion work', 'emotional reflexivity', and  
470 'managing relationships with participants' and 'emotion work to cope with emotive  
471 dissonance'. We strived to develop and maintain trust and rapport with the  
472 participants, as well as self-awareness and self-confidence around our remit,  
473 boundaries and needs. Often we glided between various different faces within and  
474 between interviews with participants and interactions with colleagues, maintaining a  
475 situation-appropriate 'professional face' (Bolton, 2001) to protect participants feelings  
476 and ultimately complete data-collection, yet 'giving a little extra' warmth,  
477 understanding, or reassurance, to maintain rapport, akin to the 'humorous face'  
478 (Bolton, 2001) or 'philanthropic' emotion-management (Bolton and Boyd, 2003). Being  
479 able to outwardly display what was perceived to be the 'right' and appropriate  
480 response - a balance between empathy, sympathy, concern and/ or interest, was often  
481 challenging because of our own shock or anger. We became emotional 'jugglers' and  
482 'synthesisers', matching face with situation (or not) which on reflection, was sometimes  
483 'sincere' (face matching feelings), but at other times 'cynical' (masking true feelings)  
484 (Bolton, 2001).

485

486 Further, whilst Bolton (2001), suggested the 'smiley face' was a means of appeasing  
487 dissatisfied patients, EM was also aware of using this in a different sense, as a defence  
488 mechanism, to mask or hide own distress. For instance, during one difficult interview  
489 where the participant was very upset due to ongoing, unexplained and troublesome  
490 neurological symptoms:

491 *"Staring at my image on the screen [during interview], I was conscious of smiling a lot*  
492 *and queried whether this was seen as inappropriate given her distress"* (EM journal  
493 entry, December 2021).

494 In discussion with EM, NA recalled a similar experience: *“In the most difficult interview*  
495 *I had, when [the participant] was speaking about their poor mental health, I listened*  
496 *carefully and attentively, maintaining a supportive -and concerned- expression and I*  
497 *let them talk it all out. It upset me, some of the topics, hearing what [they] said. I had*  
498 *recently had a situation in my personal life, where someone I am connected to had*  
499 *had some bad news, and the topics [the participant] spoke of were very similar in*  
500 *subject. I maintained my concerned expression, but inside I felt terrible, and was*  
501 *thinking about the pain [the participant] was experiencing, but also how this may have*  
502 *also been a similar experience to others. Although I maintained a professional focus,*  
503 *and a neutral, concerned and supportive expression and dialogue, I felt when the*  
504 *interview finished that this whole process had a high emotional cost for me. When the*  
505 *call finished, I sat for a while and allowed myself ten minutes to decompress, before*  
506 *dealing with all of the interview admin and electronic storing of the interview video and*  
507 *transcript and preparing for the next interview. When going back to analyse the*  
508 *interview multiple times, I’ve always felt a ‘shadow’ of these emotions when re-*  
509 *engaging with the participant’s dialogue, and when re-watching the video, I feel my*  
510 *calm and concerned expression in the recording and the stressed and emotional*  
511 *internal emotions I was concurrently experiencing during the call are incongruous”.*  
512 (NA, summary from notes, November 2021).

513

514 The experience of conducting these highly emotive interviews led to stress and various  
515 other symptoms (perhaps expressions of vicarious trauma) for us the researchers  
516 (such as insomnia and difficulties switching off). If left unaddressed through various  
517 measures illustrative of ‘strategic emotion work’ and ‘emotional reflexivity’ (such as  
518 exercise, taking time out and critically reflecting on and discussing experiences with  
519 colleagues in the team), this could have potentially resulted in detrimental outcomes  
520 to both our wellbeing and ability to continue interviewing for the study. It should also  
521 be highlighted that recognition -and development- of the spectrum of the emotional  
522 labour experience and awareness of the effects of this emerged *both* gradually:  
523 tracking the research study timeline, *and* as polarised moments of ‘realisation’.  
524 Gradual realisation for the compound emotional effects of interviewing were  
525 experienced when conducting two interviews in a day, many interviews in a week, and  
526 revisiting interview content and themes daily over a period of longer than eighteen  
527 months when conducting thematic analysis (NA and EM). ‘Polarised’ moments of

528 realisation occurred more directly - particularly challenging interviews took place that  
529 involved distressing themes exemplifying the extent of the negative effects of Long  
530 COVID, often ending with participants asking for clarification or advice about their  
531 symptoms, which the researchers were unable to offer due both to their position as  
532 non-clinicians, and as researchers themselves only beginning to understand the  
533 severity in impacts of Long COVID illness upon NHS workers.

534  
535 Additionally, it must be acknowledged that both the degree of distress exhibited by the  
536 participants and our emotional labour experiences may have had some impact on the  
537 data collected. At times, we skipped questions where these were likely to exacerbate  
538 participant's distress. Also, managing our own difficult feelings, like shock, stress and  
539 fatigue, potentially had some impact on our performance as researchers, how we  
540 engaged, built rapport and asked questions. Being flexible and tuned into both the  
541 needs of the participants and our own was key here.

542 Despite this and the toll of emotional labour, there were clearly positive aspects, as  
543 discussed elsewhere (Riley and Weiss, 2015), particularly in terms of a sense of  
544 enjoyment, job satisfaction and privilege in being entrusted with participants stories.

545

### 546 3.2. Reimagining data-collection: the implications of remote interviewing

547 *'She sounded upset, but her screen appeared dark, she was almost hidden in the*  
548 *shadows...I couldn't see her clearly, but think she was crying. I felt a bit helpless,*  
549 *what could I do or offer her...nothing really...the interview ended and my screen was*  
550 *blank, and I didn't feel great about it.'* (EM journal entry, December 2021)

551

552 Many of the participants were either too unwell to leave their homes, suffered from  
553 severe fatigue worsened by activity, or were highly concerned about COVID re-  
554 infection, all of which would have likely precluded in-person contact even if (and during  
555 periods when) restrictions were lifted. Remote interviewing via MS Teams, thus,  
556 usefully enabled us to capture their voices. This method also allowed us to read facial  
557 expressions and outward signs of distress and respond appropriately (though some  
558 other non-verbal signs of distress, such as toe-tapping or clenching fists, were not as  
559 easy to capture via this remote method). Also, opportunities to provide direct support  
560 or comfort in response to participant's distress (such as taking time to chat informally  
561 to 'warm-up' before the interview, gestures of touch, offering tissues, etc) were limited,

562 arguably affecting rapport. As a practical consideration, many participants had been  
563 off work long-term due to their ill-health and as such had no prior experience with MS  
564 Teams (feeling like ‘technology had left them behind’), whilst others had limited  
565 technological experience and - coupled with Long COVID symptoms like brain fog and  
566 fatigue - struggled to engage with this platform. Additionally, there were various  
567 technical hitches (e.g., poor Wi-Fi connection), which interrupted the flow of some  
568 interviews. At times we had to resort to telephone interviewing, which further reduced  
569 opportunities to develop rapport, engage and respond appropriately.

570 Further, by means of a screen, we as well as the participants, had privileged and  
571 reciprocated access or ‘backstage passes’ to the ‘backstage’ areas of homes,  
572 including bedrooms (in some cases, where participants were bed-bound), arguably  
573 among the most private of backstage spaces (Goffman, 1959). As the normal  
574 expectations that impose frontstage behaviour are essentially removed when engaged  
575 in backstage behaviour, with individuals generally more relaxed (Goffman, 1959), it  
576 may be queried therefore, whether this also contributed to the participants openness  
577 to share sensitive and distressing details about their experiences – and in turn, our  
578 emotional labour. Nevertheless, the setting was still staged to an extent as we and the  
579 participants had some control of what and how we presented on camera, as also  
580 acknowledged elsewhere (e.g., Serpa & Ferreira, 2018). Cumulatively, these  
581 considerations illustrate the ‘strategic emotion work’, emotional reflexivity and work  
582 around managing relationships with participants undertaken.

583

### 584 3.3. Adapted modes of support for researchers

585 *“It felt good to chat to the others [researchers in my team] today [via MS Teams]  
586 ...we’ve all had some tough interviews...I know I have their support...but it’s times like  
587 this I miss being in the office.”* (EM, journal entry, November 2021)

588

589 Given the intense emotional toll and the complex emotional labour negotiated whilst  
590 interviewing for this study, as well as the challenges presented by the wider socio-  
591 political context at the time, it was perhaps unsurprising that we all experienced some  
592 ‘symptoms’. These included feelings of stress, difficulty ‘switching off’ and insomnia,  
593 alongside ongoing rumination surrounding experiences and topics discussed by  
594 interviewees. In addressing these thoughts and experiences or ‘intrapersonal’ aspects  
595 of emotional labour (Riley and Weiss, 2015), it was essential to have opportunities and

596 space to reflect on and 'talk through' feelings, to vent and share in a safe space, to  
597 both support wellbeing and to be able to continue to maintain a professional front and  
598 perform the researcher role (illustrative of aspects of the 'strategic emotion work' and  
599 'emotional reflexivity' undertaken). Yet as contact with colleagues had to be managed  
600 via MS Teams, it may be queried whether this approach impeded the delivery of  
601 support (a key consideration in our 'management of relationships with colleagues').  
602 Firstly, this meant that there was not an opportunity to access and provide support via  
603 the normal face-to-face ad-hoc discussions and interactions with colleagues that  
604 coming together in a physical space - an office environment - facilitates. Secondly,  
605 we often had to organise evening interviews due to either childcare responsibilities  
606 during the day or participants preferences, and as such felt less inclined or able to  
607 seek support from colleagues outside office hours when they were 'offline'. Thirdly,  
608 though conducting interviews remotely from our own homes, given the confidential  
609 and sensitive nature of the interviews it was not ethical or appropriate to share feelings  
610 or experiences with, or rely on, our usual 'backstage' sources of support, i.e., family  
611 members (indeed our management of other relationships constituted a further  
612 manifestation of emotional labour). This presented a further challenge and perhaps a  
613 blurring of boundaries, as following distressing interviews there was no sense of  
614 leaving the physical workspace (as previously when interviews were conducted in-  
615 person within a public space) and entering the home space. On reflection, both EM  
616 and NA found it really challenging 'let go' of the emotional after-effects of interviews.  
617 EM found it difficult to leave work behind and immediately re-engage with family life,  
618 learning over time of the necessity of allowing a period to 'decompress' and recover  
619 between work and home life (as also discussed elsewhere, e.g., Guy & Arthur, 2020;  
620 Scott, 2022) (and further illustrative of the strategic emotional reflexivity and emotion  
621 work undertaken).

622

623 Due to recruitment of the study being concentrated, researchers often conducted two  
624 interviews in a day. NA's journaling from this period highlighted a 'build-up' of  
625 emotional rumination over several days involving multiple interviews. NA noted 'break'  
626 days (weekends and non-interview days) often involved significant time thinking about  
627 and ordering thoughts connected to the interviewing experience. This 'intrusive'  
628 rumination underpinned writing of additional notes surrounding interviews; typed-up  
629 while 'fresh in mind' at traditionally non-work times (i.e., late evenings, early mornings,

630 weekends). Reflecting, it's unclear if there was any structured 'break' in working with  
631 interview materials, as the emotional processing of these interviews routinely extended  
632 beyond 'work time'; occurring also in the personal 'protected' down-time. In  
633 dramaturgical terms, going from interview to interview without sufficient recovery time  
634 or breaks sometimes resulted in 'deep acting' (Hochschild, 1983), as we actively  
635 concealed our exhaustion and distress from participants in subsequent interviews,  
636 which in turn heightened the emotional load.

637

638 In terms of support, as a team we agreed to have regular de-brief sessions 'as and  
639 when required' after challenging interviews, and discussed and shared our own coping  
640 strategies, for EM this involved using physical exercise as an outlet and journaling.  
641 Likewise, for NA, physical exercise represented a central component of attempting to  
642 'decompress' after challenging interviews. It was also agreed that we would utilise  
643 professional counselling services if required, which ultimately it was not as the 'in-  
644 team' support and individual coping mechanisms proved adequate. In-team support  
645 involved a reciprocal process of giving extra during emotional exchanges with  
646 colleagues off-stage - 'checking in', sharing and making sense of feelings, experiences  
647 and challenges, listening, providing reassurance, akin to 'philanthropic' emotion  
648 management (Bolton and Boyd, 2003), or displaying a 'humorous face' (Bolton, 2001).

649

650 Also, all three researchers essentially drew on their own life skills as 'social agents',  
651 as well as their professional backgrounds, training and experiences around managing  
652 emotions (Hancock, 1997), presentation of self (Goffman, 1959), self-awareness and  
653 reflexive practice (Schön, 1983), as a further means of coping.

654

#### 655 **4. Discussion**

656 We have offered an analytical account of our experiences of encountering and  
657 negotiating various types of intense and unexpected emotional labour whilst  
658 conducting qualitative interviewing for the 'LoCH' study during the COVID-19  
659 pandemic. It is now useful to consider the potential implications of this, our key  
660 learning and action points moving forward.

661

662 At the outset of the study, the extent of our emotional labour experiences was  
663 unforeseeable due to the nature, timing and context of the study. That was due to:

664 the broad (and unprecedented) socio-political backdrop at the time dictating how we  
665 all lived and worked with diminished levels of social interaction and support; the  
666 novelty of the condition and thus, limited knowledge of the devastating and enduring  
667 effects of Long COVID; as well as the highly distressing nature of the interviews.  
668 Additionally, our presumptions around our role and remit as researchers (where the  
669 extent of emotional labour was not fully acknowledged or expected), our assumed  
670 'competence' and experience in researching difficult subject matter, and the assumed  
671 position and resourcefulness of our 'professional' participants played a role. Unlike  
672 healthcare or other 'caring' professions where emotional labour is well-documented,  
673 and perhaps more obvious and expected, this is not necessarily the case with social  
674 science researchers.

675

676 Essentially, the emotional labour experienced at the outset was hidden – we 'felt' it  
677 and the effects of putting on a 'staged performance' (Goffman, 1959) to continue doing  
678 our jobs (and all that entailed), but initially did not recognise or 'name' it. Despite some  
679 of the positive aspects gleaned from this, careful consideration of how to address this  
680 is required given the array of risks to wellbeing posed by undertaking emotional labour  
681 and potential consequential impacts for research participants. Specifically, questions  
682 around how researchers can prepare for and manage emotional labour experiences,  
683 how this can be approached and supported, and why the influence of broader socio-  
684 political factors as intensifying and illuminating emotional labour experiences should  
685 be recognised. The various guises of emotional labour discussed here and presenting  
686 within other research contexts need to be recognised, acknowledged, and 'named'  
687 and plans put in place to support individuals to manage this and the potential  
688 detrimental harm (Rogers-Shaw et al, 2021; Scott, 2022). Arguably, a key aspect of  
689 this involves tackling the barriers that invisibilise emotional labour for researchers in  
690 the first place, acknowledging that all social research carries an emotional element  
691 and thus potential for emotional labour (Stonebridge, 2022). Further, making the  
692 range of emotional labour undertaken by professionals explicit enables this work to be  
693 more highly valued (Riley and Weiss, 2015).

694

695 It has been suggested that strategies to prepare for and support emotional labour  
696 experiences need to be considered at individual, project and institutional/  
697 organisational levels (Stonebridge, 2022). On an individual level, emotional labour

698 can be best prepared for and addressed through adopting emotional reflexivity  
699 (McQueeney & Lavelle, 2017), as well as open, honest dialogue about both our own  
700 emotional experiences and our subjective positions as researchers (Stonebridge,  
701 2022). In practical terms, we found our reflexive diary writing and various self-care  
702 strategies, ‘...periodically nourishing outside interests and limiting involvement...’  
703 (Rogers-Shaw et al, 2021), proved helpful in providing outlets to process our thoughts,  
704 feelings and emotional experiences and negate stress experienced. We also found  
705 setting practical and psychological boundaries useful - albeit more complicated in the  
706 context of homeworking – striving toward better work-life balance (having a dedicated  
707 workspace which could be physically left at the end of the working day and limiting the  
708 number of interviews conducted per week to allow adequate time and space to  
709 decompress and ‘recover’). Within our project team, we shared our experiences and  
710 put in place an informal plan for peer support to mitigate detrimental impacts.

711

712 Emotional roles and emotional labour experiences in researchers may not be explicitly  
713 recognised by universities. In addition to mental health support services there is a  
714 need to start conversations around this emotional role, perhaps utilising the  
715 ‘Emotionally Demanding Research Network in Scotland’ (Smillie, 2021) as a resource  
716 to support this process. Safeguards for researchers should be articulated explicitly  
717 within research protocols and considered routinely as part of ethical review  
718 procedures, akin to participant protections, with appropriate training around  
719 recognising emotional labour and managing the impacts of undertaking this work  
720 delivered routinely to support qualitative researchers (Riley and Weiss, 2015; Rogers-  
721 Shaw et al, 2021, Stonebridge, 2022). Scott (2022), extends this further by setting-  
722 out a framework to promote ethical care for qualitative researchers, emphasising the  
723 importance of boundaries, meaningful debriefing, and recognition of the impact of  
724 emotion beyond fieldwork into analysis and writing-up. Indeed, whilst our own  
725 experiences of emotional labour pertained mainly to the data-collection phase of our  
726 study, we fully appreciate how this may extend to other phases, particularly  
727 transcription, re-reading and coding data (as described elsewhere, e.g., Mounce 2018  
728 and Scott, 2022).

729

730 Further, Scott (2022) raises another important consideration around the challenges of  
731 ceasing emotional labour when studies conclude, as also discussed elsewhere (Smit

732 et al., 2021; Treanor et al., 2021), and arguably support for this should also be  
733 incorporated within an ethical care framework. Such frameworks or models of good  
734 practice merit further work and consideration with individual institutions, perhaps  
735 building on already established health and safety or safeguarding policies.

736 Based on our experiences, we would also emphasise a need for explicit  
737 acknowledgement of (and further study pertaining to) the influence of the broader  
738 socio-political context, or in dramaturgical terms, the 'setting', 'time' and 'place'  
739 (Goffman, 1959) in shaping emotional labour. Living through the COVID-19 pandemic  
740 was a universally difficult and unprecedented experience because of the frightening  
741 and unpredictable nature of the virus and the life-altering implications it brought in its  
742 wake, affecting our personal and professional circumstances. Across the research  
743 team, our personal situations and responsibilities differed and shifted over time,  
744 impacting on both on emotional labour experiences and our capacities to deal with  
745 these. In our professional roles, homeworking was not conducive to the most  
746 appropriate or helpful system of support for either us or the research participants.  
747 Whilst others have successfully used virtual peer support systems (Lisiak &  
748 Krzyżowski, 2018), for us, face-to-face and ad-hoc interactions (as and when allowed  
749 at a later stage) were more useful. Also, homeworking created a blurring of boundaries  
750 and tensions between home and workspaces, or back and front stages and thus,  
751 divisions here were not as absolute or simplistic as Goffman (1959) suggests. Whilst  
752 these points pertain to homeworking due to COVID-19 restrictions, arguably this could  
753 be extended to include homeworking per se – particularly as the number of employees  
754 home-working or hybrid working since the pandemic has increased - and is thus,  
755 relevant in a more global sense.

756 Further to key learning, it is important to consider the implications of the  
757 methodological approach adopted within this study. Despite acknowledging some of  
758 the key criticisms of collaborative autoethnography - particularly around a lack of  
759 accountability, representativeness and generalisability of findings - pursuing this multi-  
760 vocal approach in the context of our emotional labour experiences served to offer a  
761 '*...more in-depth understanding and learning of the self and others*' (Chang et al, 2013,  
762 pp.23-24) and enhanced the richness of the data presented here. Nevertheless, had  
763 we planned to undertake a collaborative autoethnography at the outset of the *LoCH*  
764 *study* rather than applying this approach retrospectively, we could have included other

765 sources of data (such as interviews with and observations of each other, probing our  
766 writing and recollection of experiences), and unpicked other considerations such as  
767 the well-documented gendered aspects of emotional labour (Riley and Weiss, 2015).  
768 Collectively this may have captured different insights, further nuances and enhanced  
769 data-richness.

770 Nevertheless, planning to undertake a collaborative autoethnography of our emotional  
771 labour from the outset would have been impractical. Firstly, we did not realise the  
772 enormity of our emotional experiences or the importance (and arguably, necessity) of  
773 documenting, reflecting on and sharing these with each other or a wider academic  
774 audience. Reflections, and awareness of the overarching impacts of conducting such  
775 challenging research manifested and were recognised over time; particularly as a  
776 product of the same researchers who conducted the majority of the qualitative  
777 interviews (re)analysing these materials iteratively over a period of eighteen-months;  
778 're-living' the anguish and upsetting experiences of the interviewees (NA and EM). As  
779 no further contact with interviewees was instigated, it was impossible to ascertain if  
780 interviewees had recovered. Due to this, it was easy to perceive interview data as  
781 comprising a static -ongoing- (mostly) negative reflection of participants Long COVID  
782 illness, instead of a temporary low-point in their possible recovery or coping journey.

783  
784 Secondly, we would have had to concurrently collect and manage (in the confines of  
785 limited time) two sets of inter-related data – that pertaining to the participants  
786 experiences of Long COVID in line with our funding requirements, and a second  
787 dataset around our emotional labour experiences. Thirdly, with time pressures and the  
788 firm emphasis in academic research on securing external funding and publishing  
789 'REF-able' outputs (or those which meet the criteria of the Research Excellence  
790 Framework – see <https://www.ref.ac.uk/>), pursuing and writing-up this type of research  
791 – both in terms of subject area and methodology - is not widely prioritised (but arguably  
792 a vital area to pursue in terms of researcher wellbeing and sustainability and furthering  
793 discussion within this area).

794

## 795 **5. Conclusion**

796 Regardless of the background, competence and prior experience of individual  
797 researchers, the possibility and impact of emotional labour must be recognised as well

798 as formally and strategically planned for across individual, team and institutional  
799 levels, at the outset of every qualitative, empirical study. Strategies for addressing  
800 researchers emotional labour should be considered as part of study protocols, and  
801 appropriate training provided to support individuals and teams recognise, process and  
802 manage this at every stage of the research process. This approach should embrace  
803 and aid open-ness, transparency and flexibility at multi-levels, recognise the individual  
804 capacities and challenges of researchers and teams, and critically, the influences  
805 pertaining to the broader socio-political context at the time. This is important in  
806 recognising and supporting the experiences and needs of individual researchers, as  
807 well as successful completion of fieldwork. Further work to support the development  
808 of an ethical care framework is required, sourcing and drawing on any local, national  
809 and international examples of good practice. It is critical to draw attention to and  
810 normalise discussions of researcher emotional labour, wellbeing and unanticipated  
811 role-pressures experienced in similarly structured research and this paper contributes  
812 to this discussion. Lastly, Goffman's dramaturgical perspective provided a useful  
813 means for us to critically reflect on, analyse and understand the significance of both  
814 ours and the participants presentation of self, our interactions, and the impact on our  
815 emotional labour experiences. Nevertheless, this theoretical underpinning was  
816 somewhat limited as failing to fully embrace the nuances and blurring of boundaries  
817 between backstage and frontstage areas in the complex context we found ourselves  
818 living and working, again an area which merits further consideration.

819

## 820 **Funding**

821 This work was supported by the Chief Scientist Office (COV/LTE/20/32). Sponsor had  
822 no role in the study design, the data- collection, analysis and interpretation of data; in  
823 the writing of the report or in the decision to submit the article for publication.

824

## 825 **Acknowledgement**

826 We would like to acknowledge the very important contribution of the research  
827 participants in the *LoCH* study and thank them very much for sharing their time and  
828 experiences to inform the research.

829
